### **EXECUTIVE SUMMARY**

#### The NLSIP Project:

Nepal Livestock Sector Innovation Project (NLSIP) is being implemented by the Government of Nepal's Ministry of Agriculture and Livestock Development (MoALD) with support from the World Bank (WB). The NLSIP aims to improve the production and productivity of milk, meat, and pashmina production and productivity in order to raise prodcer farmers' income. The project, which ran from February 2018 to June 2023, was expected to attract private and public sector investment in livestock-related businesses and services by investing in innovative support programs such as service delivery, access to information, technology, market development, and competitive enterprise development.

The project's objectives were to increase smallholder farms' and agro-enterprises' value addition, productivity and climate resilience in a few chosen livestock value chains in Nepal. The project was expected to support the country's priorities since it was in line with the four strategic pillars of Agriculture Development Strategy (ADS): governance, productivity, commercialization, and competitiveness. The four Key Performance Indicators (KPIs) the project sought to meet were as follows: (i) Increased productivity of targeted livestock commodities, (ii) Increased sales of value-added products in targeted value chains, (iii) Farmers adopting climate-smart agricultural technologies, and (iv) Farmers reaching out with agricultural assets or services.

Four Decentralized Level Support Units (DLSUs), acting as cluster-level offices, carried out the project's implementation. Each cluster comprised local governments (municipalities and rural municipalities), producers' organizations, entrepreneurs, and consumers. These clusters covered 12.4 million people (6.4 million of them were female) and spanned 289 municipalities in 28 districts across five provinces. The project's decentralized approach promoted inclusivity and equity in its execution by enabling it to effectively reach and engage with a broad range of stakeholders in different geographical regions. In order to accomplish the Project, a cluster strategy and value chain development methodology were used. The primary project beneficiaries would be 200,000 livestock producers (at least 45% of whom are women) and 500 small and medium-sized agro-entrepreneurs.

Additionally, 601 agro-enterprises were to receive matching funding from the project for the production and post-production value chain. The agro-enterprises were required to propose the selected business plans had to be proposed by agro-enterprises and these had to be evaluated and funded with a combination of project grants (up tpo 50% or NRs. 10 million), required bank and financing institutions loans (at least 30%) and cash contribution in the form of equity (at least 20%).

#### **Present Assignment of Endline Survey**

The current assignment involved gathering and analyzing primary data to assess the project's impacts, effectiveness and outcomes. An endline survey was required to assess the impact of the project's interventions at the households, POs, and sub-project levels because the project was to be phased out by June 2023. The main objective of the endline survey was to evaluate the impact of project interventions on beneficiary households and sub-projects. The endline survey aimed to achieve three goals: (i) collecting socio-economic data of sampled POs and households that are project beneficiaries, (ii) poviding data relevant to the project result framework indicators to measure the project's effectiveness and impact; and (iii) making recommendations to improve the effectiveness of similar future projects. To quantify (i) the impact of the overall project interventions (Task-1) and (ii) the impact of matching grant supports (Task-2), the consulting firm was given two distinct tasks to analyze.

#### Survey Methodology

This study used a mixed-methods approach, gathering data from primary and secondary sources using both quantitative and qualitative research techniques. Primary data were collected through a household survey of beneficiary households and sub-projects related to the dairy, goat meat, and Chyangra Pashmina value chain commodities. Secondary data were collected by reviewing relevant project documents. The sample plan, designed by the NLSIP project, was used. The project applied a purposive sampling design to select POs and households. As recommended, a sample size of 1505 HHs were selected, which included all POs that were surveyed during the baseline in 2020, as well as those surveyed in both HHS1 (2021) and HHS2 (2022), and POs that were only surveyed in either HHS1 or HHS2, based on the list of farmer groups and cooperatives, as well as sub-projects, provided by the Project.

As such the survey team gathered information from 1182 households under Task-1 and 1053 individual households and 449 sub-projects, which were supported by the project under task 2. As control groups, 179 POs and private farms that submitted a business proposal but were not chosen for the project, were interviewed. In addition, 29 key informant interviews, 8 individual interviews, and 8 focus group discussions were carried out to collect qualitative data and to triangulate the primary data. The KOBO Toolbox was used to create the online survey and the data were stored online at www://kobo.humanitarianresponse.info. The data were cleaned, analyzed, and presented in tables, graphs, and charts in accordance with the indicator requirements.

#### **Findings:**

#### (1) **Progress on PDO indicators:**

**Productivity:** The milk productivity per year per standing cow which was 1222 litre in baseline (2020), increased to 1232 liter in 2021, 1498 liter in 2022, and 2239 litre in 2023. Similarly, milk productivity per year per standing buffalo was 720 litres in baseline (2020), increased to 749 liters in 2021, 815 liters in 2022, and 1346 liters in 2023. The productivity of goat, measured in carcass weight, which was 7.8 kilograms per goat per year in 2020, decreased to 3.9 kilograms in 2021, increased to 5.42 in 2022, and increased to 13.48 kilograms in 2023.

**Sales value:** Sales value of milk and milk products per household per year which was Rs. 396 thousand in 2020 (baseline) increased to Rs. 402000 in 2021, Rs. 484 thousand in 2022, and Rs. 599000 in 2023. Most of the sales income of dairy households were from raw milk sale. The sales value of goat meat per household, which was Rs. 56000 in 2020 (baseline), increased to Rs. 60000 in 2021, Rs. 75000 in 2022, and Rs. 107000 in 2023 (endline). Goat farming households derived the majority of their revenue from the selling of live goats.

Adoption of Climate Smart Agricultural Technologies (CSATs): On the seven-climate smart agricultural tehnologies (CSATs) promoted by the project, 59% of farmers utilized to use improved shed management technologies, followed by manure management (46%), fodders, forage production, and pasture development (26%). In the livestock farm, the percentage of CSATs adopted rose from 77 to 63 in 2020 and 2021 to 100% in 2022 and 2023, respectively. Women's participation in CSATs went from 56% in 2020 to 96% in 2023, indicating that women are becoming more involved in the usage of CSATs in livestock farms.

Access to productive assets and services: Among the assets received by the farmers in 2023, maximum (41 %) of farmers had access to sheds provided by the project, which was 8.6% in 2020, and 14.7% in

2021. The next important livestock asset was the chaffcutters. Thirty three percent received it in 2023, which was 15.6% in 2020, and none in 2021 and 2022. Of the access to assets, the proportion of women receiving assets were 17.4 % in 2020, 22.1% in 2021, and 66% in 2023. Similarly, among the services, 33.4 % of them received Artificial Insemination (AI) services from the project in 2023, compared to 0% in 2020, and 1.9% in 2021. The vaccination services against FMD and PPR, which accounted for 26.5% of cases in 2023 compared to 5% in 2021, were the second key service. The percentage of women receiving these services were quite low.

#### (2) **Overall Impact of the Project (Task 1):**

In 2023, the annual milk yield per standing cow was 2239 liters, an 83% increase from the baseline of 1222 liters in 2020. In a similar vein, the milk productivity of a standing buffalo in 2023 was 1346 liters per year, an 87% increase over the baseline of 2020 (720 liters). Compared to baseline output of 7.8 kg per goat annually, goat productivity grew by 73% in 2023 (13.5 kg per goat annually) as determined by carcass weight. The increased milk productivities were due to increased number of improved cow and buffalo and reduced number of local breeds, increased number of lactating cow and buffalo in the herd, and thereby reducing overall herd size, and increased lactation length.

These encouraging outcomes were made possible by the project's supports, which included component B's use of climate-smart agriculture technology, parasite control, AI services, and vaccination against FMD. When it came to goats, goat farmers used to reduce the size of their herds by adding more exotic and cross-bred breeds. To help them, various programs were put in place, including those that promoted stall feeding, vaccinated against PPR, controlled parasites, and used climate-smart agricultural technologies like better shed management, increased fodder and forage cultivation, manure management, and stall feeding in goat farms.

The annual sales value of milk and milk products per household grew by 51% from NRs. 396000 in 2020 (the baseline) to NRs. 599000 in 2023. In 2023, 93.5% of the milk output was sold; of that, 99% was sold as raw milk, down from 98.5% in 2020. This indicates that there was very little milk value addition in both the baseline and endline years. In 2020, the average selling price of raw milk was recorded at Rs. 62.1 per litre; by 2023, it had risen to Rs. 67.5 per litre. The sales value of goat meat per household climbed by 93% from NRs. 55670 in 2020 (the baseline) to NRs. 107350 in 2023. In 2023, it was reported that 176.49 kg live weight, or around 42% of the entire output of goat meat, was sold for an average price of Rs. 608.27 per kg. In contrast to 2020, when there was 6% value addition in the form of raw meat and buck sales, there was no value addition in goats seen in 2023.

The amount of milk sold per household, which was 6312 liters in 2020 but climbed to 8749 liters out of 9351.77 liters of production in 2023. It showed that the project boosted the sales value of milk at the household level in 2023. In a similar vein, the value of goat meat sold per household grew by 93% in 2023 compared to the baseline, with goat meat sales (on a live weight basis) rising from 92 kg in 2020 to 176 kg in 2023. Due to an increase in selling price, the sales value of live goats in 2023 grew as well; on a live weight basis, the goats' 2020 price of Rs. 569 per kg jumped to Rs. 608 in 2023. Following the inflation adjustment, there was 31.35% increase of milk sale and 67.4% of goat sale from baseline (2020) to endline (2023).

In contrast to 77% in the baseline year (2020), nearly all producer farmers in endline (2023) utilized to implement at least one CSAT on their farms. Women's participation grew from 43.29% in the baseline (2020) to 96% in the endline (2023). This shows how the project-NLSIP assisted women in implementing climate-smart agriculture technology on their livestock farms. The application of CSATs was found to be beneficial to livestock farms, as evidenced by the 86% of farmers who reported

increased production, 65% reporting reduced livestock health issues, 45% reporting increased feed availability, and 40% reporting improved livestock reproduction.

In 2023, 74.3% of project beneficiaries had insurance for dairy livestocks, up from 50.5% in 2020 and a 47% increase. Goats saw a 77.64% increase in percentage, from 16.1% in 2020 to 28.6% in 2023. However, in actuality, the insurance coverage in 2023 has been seen to be far less than anticipated in the dairy and goat industries, with no insurance in the Chyangra. Consequently, the aggregate percentage of project beneficiaries applying livestock insurance policies throughout all three value chains has been seen to be 47%, compared to the target of 60% in 2023, with 78.4% of the target achieved. Only 24.5% of women beneficiaries had livestock insurance policies, compared to a target of 45% in 2023—a 54.5% advancement against the target This lower level of insurance coverage resulted from the failure to implement the mandatory insurance provision for task-1 households, among other factors including the undervaluation of pure and exotic breeds, the slow settlement of compensation claims, the absence of insurance for young livestocks, and the extremely complicated administrative processes involved in collecting compensation.

Among the assets received by dairy farmers in 2023, maximum (56 %) of dairy farmers had access to milk cans provided by the project. The shed was the second most valuable livestock asset; in 2023, 33.5% of dairy farms had access to sheds. In 2023, almost 32% of dairy farms have chaff-cutters, while 20.4% possessed live livestocks. Among the services dairy farmers obtained from the initiative in 2023, 77% of them got Artificial Insemination (AI) services, compared to 0% in 2020. In a similar vein, the project provided vaccination services to 34% of dairy producers, a percentage that was zero in 2020. Shed access was available to around 45.5% of goat farming households in 2023, up from 18% in 2020.

About 16.5% of goat rearing farmers received live livestock (goats) and 32% received chaff-cutters. Among the services, about 20% of goat rearing farmers received vaccinations, 21% received medicines for parasite control, and 10 to 12% received forage seeds from the project. 65% of Chyangra rearing farmers had access to sheds, 53% owned solar panels, 35% owned weighing balance, and 94% of them owned chaff-cutters in 2023. More than 76% of Chyangra rearing farms had access to vaccination and medicines.

About two third (64 %) of the beneficiaries were "satisfied" from the services provided by the project, of them 6% were "highly satisfied". However, around 19% of them were "unsatisfied". This can be because the project did not offer adequate assistance, and a large number of them were not eligible to obtain grant funding (sub-projects) from the project. While goat growing farmers were happier with all services offered by their POs, dairy farmers were more satisfied with technical training, account training, nursery management, and marketing services.

At the household level, the production cost per liter of milk was estimated to be Rs. 45.30, up from Rs. 44.60 in the baseline (2020) and an additional Rs. 0.70 per liter. In 2020, the profit per litre of milk was Rs. 17.5; by 2023, it had risen to Rs. 22.20. Similarly, the cost of producing goat meat on live weight in 2020 was Rs. 178.10; by 2023, that cost had risen to Rs. 249.94, or Rs. 71.84 per kg. Profit per kilogram of goat (based on live weight) was Rs. 391 in 2020 but dropped to Rs. 358 in 2023. Comparing between dairy and goat enterprises under task-1, goat enterprises were found more profitable than the dairy, as the Return on Assets (RoA), Net Profit Margin, and Return on Labour in goat enterprises were estimated to be 126%, 59% and 62% respectively as against 37%, 33% and 40% in dairy enterprises in the year 2023. However, the profitability ratio of dairy enterprise is observed as satisfactory, in principle.

According to data from 2023, a livestock enterprise could, on average, generate 2.6 full-time employees (Rs. 539,760), of which 2.4 were family/self-employed (Rs. 498,240), and very little in the way of paid

labours. It was shown that women contributed more to the rearing of livestock than men did, accounting for 57.5% of all labour hours. Comparing among three value chains, dairy enterprise could generate 2.4 full-time employees (Rs. 498,240) per household/enterprise for full year. Women were found more involved in the dairy enterprises, contibuting 56% of their time. In case of goat value chain, 2.65 persons of labour employment (Rs. 550,140) was found to have been generated per goat farm for the whole year, of which 2.39 persons (90% of total employment) is from family labour or self-employed in the goat enterprise. As also in the dairy enterprise, women were found to have been engaged more (55%) than the men (45%) in the goat enterprise. For the entire year (Rs. 635,256), it was discovered that the Chyangra Pashmina value chain employed 3.06 people, of which 2.65 were family workers or self-employed (Rs. 550,140) and 0.41 were hired laborers (Rs. 85,116). In the Chyangra Pashmina enterprise, women labor involvement was found to be much lower than in the other two, accounting for just 38.5% of the total work load.

About 77% farmers were found selling their livestock products to the buyers and sellers in 2023. Of the sellers (farmers), 11% had formal agreement with the buyers and traders. Of sellers and farmers selling livestock products, 8.3% used to sell to NLSIP-supported buyers and traders, 41.5% to other organization supported buyers and traders, and rest 50% to other buyers. Nearly 19% of the sellers and farmers reported that there is compliance of agreement (both formal and informal). Of milk producers, 22% were found to have established formal linkage (formal agreement) with the buyers, and rest 78% used to sell with informal agreement. Of milk sellers, 16.5% used to sell to the NLSIP-supported traders, and 37% of the milk sellers reported that there is compliance of the agreement, irrespective of formal or informal agreement. In case of goat value chain, 68% of households reported that they sold goat during last year (FY 2022/23), and mostly on informal basis.

The average income for a household operating a dairy business under Task-1 was Rs. 746,615.00, of which Rs. 598,960.00 per household was earned from the sale of milk and milk products annually. This income accounted for 80.22% of the total household income in 2023 and increased by 51.25% over the baseline average income of Rs. 396,000.00. The average family income of farmers who rear goats was also assessed to be Rs. 356,203.00; of this, 30% came from the sale of goats, or Rs. 107,351.00 annually, an increase of 93% over the sales value of goats recorded in the baseline (Rs. 55,667.00).

About 91% of the households reported to have food sufficiency in 2023, which in the baseline (2020) was 0.14%. Only 2.4 % of them reported to have food sufficiency with less than 3 months in 2023, which in 2020 it was nearly 25%. These results have clearly indicated that the Project has significant contribution in increasing the food sufficiency level among the beneficiary households. Comaparing among value chains, about 85% of dairy households reported to have food sufficiency in 2023, which was only 0.3% in the baseline (2020) and 21% of dairy farmers who had food sufficiency of less than 3 months in 2020, decreased to 3% in 2023. Similarly, in the goat value chain, about 96% of the households reported to have food sufficiency in 2023, where there were no such farm families having food sufficiency in the year 2020 (baseline) and 25% of goat rearing farmers who had food sufficiency of less than 3 months in 2020, decreased to around 2% in 2023. In Chyangra Pashmina value chain, 82% farmers reported to have food sufficiency in the year 2020, who had less than 3 months of food sufficiency in 2020 (baseline), and 53% of them in 2020, who had less than 3 months of food sufficiency in 2020.

It was found that 11% of households had taken out loans for their livestock business; this represents a 104% rise from the baseline of 5.36%. In 2023, 16%, 7.4%, and 5.9% of farm families utilized loans for the dairy, goat, and Chyangra Pashmina value chains, compared to 9%, 2%, and 2% of farm households during the baseline period. This shows farmers were encouraged to take out loans for their livestock businesses following the NLSIP intervention.

Nearly 80% of farm households used to use green forage for their livestock, followed by concentrate feed (57%), dry forage (37.5%). When comparing the three value chains, it was found that dairy and goat farms used to use more concentrates, green forage, and dry forage as feed, whereas chyangra farms used to use more hay/silage, dry forage, and green forage.

The majority of dairy farms were found to be innovating through the use of cow mats (27%) and urine collection (25%). Food safety and hygiene procedures, such as cleaning sheds (73% of farmers), washing livestocks (50%), cleaning utensils (41%), using boots, gloves, and aprons (30%), and cleaning udders before to milking (27%), are implemented in the majority of livestock farms. It was found that about half of the farmer households (52%) had built compost pits, and 19% of farms had built compound walls and urine pits as social and environmental safety measures. Just 4.5% of farms have built drainage systems, and less than 1% of farms have marble or tile floors and walls. Comparably, around 53% of farmers once used gumboots, 34% gloves, and 17% masks, 3% of farmers used aprons, and less than one per cent farmers used to use helmets for personal protections while working in their livestock farms.

The majority of farmers (70%) and buyers/traders (2.71%) reported having access to market information via their respective groups or cooperatives. Almost 79% of dairy farmers, 63% of goat rearing farmers, and 88% of Chyangra rearing farmers used to receive market information from their groups/cooperatives.

#### (3) Sub-Project (Matching Grant) Impact Evaluation of the Project (Task 2):

In comparison to its baseline (1174 liters), the cow milk productivity at sub-project level (Call-1 & II, individual household level) rose by 73% to 2029 liters per year per standing cattle by the end of 2023. The production of buffalo milk rose from 758 liters per year per standing buffalo in the baseline (2021) to 1663 liters in the endline (2023), representing a 199% increase. The production of goat meat, measured in carcass weight, for each standing goat in the herd grew by 304% from 3.5 kg in baseline (2021) to 14.14 kg in Endline (2023).

The larger herd sizes of lactating cows and buffaloes in 2023—by 84% and 77%, respectively—as well as the longer lactation periods in both species in 2023 compared to baseline contributed to the higher milk yield. In comparison to the baseline, they helped to raise the amount of milk produced per household by 130% in buffalo milk and 124% in cow milk in 2023. In the case of goats as well, the project's involvement resulted in an average of 14 more goats per household, accounting for 304% of the increase in output. As a result, the herd size per household that received funding for the initiative increased from 11 in the baseline to 25 in 2023—a 128% increase. This substantial increment of herd size had positive impact on the meat production per household, which was 73 Kg (on live weight) in baseline (2021) increased to 553 Kg in the year 2023 (endline), with 659% of increment within two years.

By endline (2023), the productivity of cow milk at sub-project level (Call-1 & II, collective/PO level) was determined to be 2104 liters per year per standing cattle, a 98% increase over its baseline (1063 liters). The production of buffalo milk rose from 587 liters per year per standing buffalo in the baseline (2021) to 1482 liters with a 152% increment in the endline. Measuring in carcass weight, the production of goat meat per standing goat in the herd grew by 322% from 3.56 kg in 2021 to 15.02 kg in 2023.

As compared to baseline, the herd in 2023 had a higher percentage of improved breed and a lower percentage of local breed, which resulted in higher milk output for cows and buffalo at the PO level. With regard to goats, the project's involvement in the goat value chain as grant sub-projects operate jointly resulted in an increase in herd size in 2023 that increased productivity by 15% on average per

PO. The production of milk and meat was positively impacted by the POs' deployment of better and climate-smart technology as well as by their increase in herd size.

In comparison to its baseline (2022) of 1583 liters, the cow milk productivity at the sub-project level (Call-III, private farm) grew by 39% to 2200 liters per year per standing cattle by the end of 2023. The output of buffalo milk rose from 827 liters per year per standing buffalo in baseline (2022) to 1534 liters with an 85% rise in 2023. The private farm's annual carcass weight per standing goat went from 3.81 kg in the baseline (2022) to 17.37 kg in 2023, a 356% increase in goat meat yield.

The herd sizes of improved cows (97%) and buffaloes (54%), as well as lactating cows (181%) and buffaloes (138%), increased in the private farms in 2023 led to an increase in milk productivity of cow and buffalo. This, in turn, contributed to an increase in milk production (cow milk by 186% and buffalo milk by 199%) per private farm in 2023 compared to the baseline (2022). In the case of goats, productivity increases in 2023 were caused by an average 265% rise in herd size, with pure-bred/exotic herds growing by 26% and cross-bred herds growing by 125%. The output of live weight meat per farm grew from 294 kg in the baseline to 3336 kg in the endline.

The productivity of cow milk at PO levels in 2023 (Endline: Treatment) was 7.5% higher than that of its Control POs, indicating productivity of 2050.27 liters per year per standing cattle, as compared to control POs (1918.83 liters). Similarly, the productivity of buffalo milk at PO levels in Endline Treatment in 2023 was 44% higher than that of its Control POs, indicating higher productivity (1358.75 liters per year per standing buffalo) in treatment POs as compared to Control POs (942.72 liters per year per standing buffalo) in 2023. Similarly, the productivity of goat meat, measured in carcass weight, at PO levels in Endline Treatment in 2023 was determined to be 7.5% higher than that of its Control POs, indicating slightly higher productivity (15.76 kg per standing goat annual).

Because the increased cow herd size per PO was 81% larger than that of the control POs, the treatment POs had higher cow milk productivity than the control POs. The treatment POs had a herd size that was 25% larger overall than the control POs, and the lactating cow herd size was also 16% larger in the treatment POs than in the control POs. Furthermore, lactation durations were longer in treatment POs compared to control POs for both local and improved cows. Similarly, a 19% increase in herd size in the treatment relative to the control PO explained the higher buffalo milk output in the treatment over the control POs. Additionally, there were 20% and 90% more improved and lactating buffalo, respectively.

These factors contributed to the increased milk production among the POs, which eventually contributed to the increased milk productivity among the POs. When it came to goats, the introduction of exotic or pure breeds into the herds in the treatment POs and a notable rise in the size of the herds of indigenous and improved goats were the main causes of the increased production in those areas. As a result, the herds at PO level produced more goat meat than the control POs (by more than 500% when comparing live and carcass weight). When compared to the control POs, the goat enterprise's enhanced parameters at the treatment PO level resulted in higher meat production, which in turn contributed to higher goat meat productivity. The project's interventions, such as the introduction of improved livestockss into the herd, the vaccination and treatment program for livestock health, the management of sheds and feeds, the promotion of fodder and forage, the promotion of climate-smart agricultural technologies, and so on, were responsible for the increase in productivity and production of milk and goat meat among the POs.

In 2023 (Endline: Treatment), the annual production of cow milk per standing livestock at private farms was 2199.94 liters, almost 6% more than that of its Control Private Farms (2077.39 liters). In 2023, it was found that the productivity of buffalo milk in the treatment private farms was 7% greater (1534)

liters) than in the control private farms (1433 liters). Measuring carcass weight, the productivity of goat meat in 2023 was found to be 108% greater in treatment private farms than in control private farms. Treatment private farms produced 17% more meat per standing goat year (17.37 kg) than the control private farms (16.06 kg).

Because the increased cow herd size per private farm was 129% larger than that of the control private farm, the treatment private farms' cow milk productivity was around 6% higher than that of the control private farms. The treatment private farms had a herd size that was 126% larger overall than the control private farms, and the lactating cow herd size was similarly larger (124% larger) in the treatment private farms than in the control private farms. These details helped to explain why the output of cow milk in the treatment private farms increased significantly to 81,899 liters annually in the same year that it only produced 30,948 liters in the control private farms. Similarly, for buffalo milk productivity, which in treatment Private Farm was 7% more over the control Private Farm, because of the reasons that total herd size of buffalo per treatment Private Farm was 113% higher with respect to control Private Farms. In addition, number of improved buffalo and lactating buffalo were also 116% and 102% higher in treatement Private Farms over the control Private Farms respectively.

These factors led to a 128% increase in buffalo milk output per private farm in the treatment Private Farms as compared to the control Private Farms. These factors played a part in the notable rise in milk output among the private farms, which in turn led to higher milk productivity among the NLSIP-supported private farms. The reason for the 8.16% increase in productivity in treatment private goat farms over control private farms was the introduction of pure/exotic breeds, cross-breeds, and local breeds, which resulted in a significant herd increase (110% higher) in treatment private goat farms compared to control private goat farms.

As a result, there was a notable increase in goat meat production in the Private Farm level herds, measured in both live and carcass weight (118% more than in control POs). increased goat meat production resulted from these parameter increases in the goat herds at the treatment Private Farm levels, and this, in turn, increased goat meat productivity when compared to the control Private Farms. In actuality, the project's interventions in the form of better livestock introduction, the advancement of climate-smart agricultural technologies, vaccination campaigns, disease and parasite control initiatives, shed management, the promotion of fodder and forage to provide livestocks with a balanced diet, and numerous other initiatives helped to boost milk and meat productivity at the private farm levels as well.

After adjusting for inflation, the value of milk sales at the sub-project levels (individual HHs) under Call I and II during Endline (2023) was found to be NRs. 750480 (at current price) and Rs. 678000 after increasing by 117% over the baseline, which was NRs. 313000 in baseline (2021). Similar to this, during Baseline (2021) the value of goat sales at the level of individual sub-projects was NRs. 77250; at current prices, this climbed to NRs. 155000, and during Endline (2023), after adjusting for inflation, it increased to Rs. 140000, representing a net rise of 81%.

Under Call-I&II, each individual farmer used to sell 8,380 liters of milk annually on average; in 2023, this figure was 4923 liters. A rise in production and sales volume from baseline to endline has also raised the value of milk sales at the level of individual households. Comparably, the typical household's production of goat meat (based on carcass weight) climbed from 47.35 kg in 2021 to 359.42 kg in 2023; thus, the meat's sales value increased as well.

The value of milk sales under Call I & II at sub-project levels (collective/PO level) during Endline (2023) was found to be NRs. 9.74 million at current prices and Rs. 8.8 million after accounting for inflation. This represents a 30% increase from the baseline, which was NRs. 6.77 million in baseline (2021). Similarly, during baseline (2021) the value of goat sales at collective sub-projects at PO level

was NRs. 817000; at current prices, this climbed to NRs. 3447000, and during Endline (2023), after correcting for inflation, it increased by 281%.

After adjusting for inflation, the value of milk sales at sub-project levels (private farms) under Call III during Endline (2023) was found to be NRs. 10.17 million at current prices and Rs. 9.77 million after increasing by 56% over the baseline sales value of NRs. 6.26 million in baseline (2022). Similar to this, during Baseline (2022) the value of goat sales at the private farm level was NRs. 435000; at current prices, this value has climbed to NRs. 712500, and after correcting for inflation during Endline (2023), it has increased by 57%. The rise in milk and goat meat production at the private farms was the reason for the 56% and 57% value increases in sales of milk and goat meat, respectively.

In Call-I&II, the value of milk sales per treatment PO was reported at NRs. 9.74 million, compared to just 4.12 million in control POs in 2023—a 136% increase over milk sales in control POs. Similarly, it was found that the goat sales values in the treatment POs were NRs. 3447000, whereas the values in the control POs were only NRs. 319000. The increased output of goat meat and milk at the PO level was the reason for the higher values of goat meat sales (1080% of control) and milk sales (236% of control), respectively.

About 95 % of households under Call I&II, found to have adopted improved shed management practices, followed by manure management (83%), fodders, and forage production and pasture development (50%). In 2023, all farmers employed at least one technology, up from 94.19% in the baseline (2021). In contrast, 75% of farmers in 2021 and 57% of farmers in 2023 employed at least two technologies, respectively, while 57% of farmers in 2023 employed at least three technologies.

Of the seven CSATs that the project supported, the majority of farmers under the Call I& II sub-projects were found to be implementing better shed management technologies in 2023; this was the case for 100% of farmers in Chyangra Pashmina, 99% in Goat Meat, and 90% in Dairy Value Chains. Manure management is the second major CSAT, with 88% of dairy farmers, 83% of goat meat farmers, and 47% of Chyangra Pashmina raising farmers using this technique. In all three value chains, about 50% of farmers used to apply methods for pasture development, fodder production, and forage production. When comparing value chains for the adoption of CSATs in 2023, every single family was found to have implemented at least one CSAT in their livestock farms.

Among seven CSATs promoted by the project, most of the farmers under Call I& II sub-projects, were found adopting improved shed management technology, which 100% in Chyangra Pashmina, 99% in Goat Meat, and 90% in Dairy Value Chains in 2023. The second important CSAT is the manure management, for which 88% in Dairy, 83% in Goat Meat, and 47% in Chyangra Pashmina rearing farmers were found adopting this technology. Around 50% of farmers of all three value chains used to adopt fodders, forage production and pasture development technologies. Comparing among value chains on the adoption of the CSATs in 2023, 100% of the individual households used to adopt at least one CSAT in their livestock farms. In the past, 92% of dairy farmers and 91% of goat- and chyangra-producing farmers adopted two or more CSATs. Approximately 60% of farmers who raised goats and dairy used to implement three or more CSATs on their farms.

In a survey of POs working on sub-projects as a group, it was found that 83% of them had implemented better practices for managing sheds; 62% had adopted improved practices for managing manure; 41% had implemented fodders, forage production, and pasture development; and 25% had implemented stall feeding as a climate smart agricultural technology (CSAT) in their livestock farms. It was found that all POs had employed at least one climate smart agricultural technology (CSAT). In 2021, 84% of POs had done so, which represents a 19% increase in 2023 over baseline (2021).

When compared to the control POs that also adopted the same CSATs, which were 84%, 38%, and 34%, respectively, the treatment POs surveyed in 2023 used to adopt improved shed management practices as CSATs in their farms, followed by manure management (62%), fodders, forage production, and pasture development (41%). With the exception of better shed management techniques, the treatment POs adopted all six CSATs in 2023 at a rate higher than the control POs. When POs in treatment and control groups were compared for the adoption of CSATs, it was found that both groups had at least one CSAT in place on their livestock farms. It was found that the treatment POs were more successful than the control POs in implementing more than two technologies on their farms.

The majority of private farms (94.5%) surveyed in 2023 were found to be implementing better shed management, followed by stall feeding (42%), manure management (81%), and fodder, forage production, and pasture development (37%). In the private livestock farms, adoption of CSATs was found to involve about 85% of women. With a 9% rise, the percentage of private farms that adopted at least one CSAT in their livestock farms in 2022—92% of them—rose to 100% in 2023. By 2023, almost 29% of private farms—up from 5.4% in 2022—were employing two CSATs. However, the percentage of private farms that implemented two or more CSATs remained almost unchanged (84%), both at the baseline and endline.

Among the treatement private farms, surveyed in 2023, maximum (94.5%) of private farms were found adopting improved shed management practices, for which in control private farms it was 88%, which is 7% more effective than the control farms. Adoption of manure management was also discovered to be the second most significant CSAT in both treatment and control private farms, accounting for 81% in treatment and 69% in control farms. Treatment farms were found to be approximately 18% more successful than control farms in utilizing the project's facilitated CSATs in the livestock farms. All private farms, including those under treatment and those under supervision, were found to have implemented at least one CSAT. However, it was shown that 83% of treatment private farms used two or more CSATs.

About 98% of beneficiary individual households under Call-I&II sub-projects (of which female 30.21%), which were implemented individually, were found to have insured their livestock (cow, buffalo, goat and Chyangra) during endline survey (2023), which was nearly 27% in the baseline (2021). Likewise, 75% of the beneficiary under collective sub-projects through Call-I&II, were found to have insured their livestock in 2023, as against 31% in the baseline (2021). In case of private farms, 58% of them were insuring their livestocks in the year 2022, increased to 84% in 2023.

When comparing value chains, the dairy value chain showed that, when Call-I&II sub-projects were implemented individually, only 30% of households insured their livestocks in 2021; by 2023 that number had risen to 97%. Similarly, 59% of POs in 2023 insured their dairy livestocks, up from 30% in 2021. There is slightly increment in insurance in dairy private farms, from 72% in 2022 to 82% in 2023. Whereas, the control private farms and POs were found relatively better in insuring their dairy livestocks.

In comparison to their baseline, there has been a significant increase in the percentage of households and POs who insure their goat in 2023. It was found that, in 2023, almost 98% of the individual households under Task-2 sub-projects, which were carried out individually through Call-I&II, had insurance for their goats, compared to 14% in the baseline (2021). Comparably, it was shown that 92% of POs had insured goats in 2023 compared to 32% in 2021. In terms of private farms, 49% of farms in 2022 had insurance, compared to 90% of farms in 2023. The treatment POs and private goat farms were found to be superior than the control POs and private farms when compared to the sub-projects under control.

In case of Chyangra Pashmina value chain, 100 % of individual farmers used to insure their Chyangra both in baseline and endline. However, it was not possible to determine the percentage of POs and households that insured their Chyangra on private and collective farms in baselines. It was found that, as of 2023, 75% of POs have insured Chyangra under Call-I&II. In contrast, 75% of control private farms utilized to insure their Chyangra in 2023, but none of the treatment private farms have been found to do so.

Seventy two percent of the livestocks in the sub-projects (private farms and POs) were found to be insured in 2023; 68% of the livestocks in POs and 78% of the livestocks in private farms had insurance. About 11% of the insured livestocks died, and only 79% of them were eligible for reimbursement in 2023—83 percent in POs and 76 percent in private farms. The lower proportion of livestock insurance as of 2023 was a result of undervaluing pure and exotic breeds, a lengthy claim settlement process, the absence of insurance for young livestocks, and onerous administrative procedures involved in collecting compensation.

In contrast to the relatively small number of households that had access in the baseline (2021), the maximum (85%) of Task-2 households were able to obtain the animal sheeds. This was followed by chaff-cutters (68%), live livestocks (64%), milk cans and AI services (44%), and so forth. However, compared to the program put in place in 2021, vaccination and parasite control efforts were found to be less in 2023. Comparing the three value chains, all individual households raising Chyangra received sheds; 98% of these households also received solar panels; 92% of dairy farmers received milk; and 90% of Chyangra rearing households received vaccinations and parasite control services from the project—NLSIP.

In 2023, a considerable proportion of POs polled under Call-I&II reported receiving production assets such as milk cans (51%), chaff-cutters (58%), sheds (58%), live livestocks (47%), and weighing balances (42%). These values are greater than those of the baseline (2021). However, in the case of services, several endline values—such as vaccination and parasite controls—are seen to be lower than the baseline values, and in 2023, none of them were reported to have gotten AI services. This might be because the NLSIP program will end in 2023. When comparing production assets and services between treatment and control POs, it was discovered that the former had greater access than the latter.

Approximately 54% of private farms obtained milk cans as assets, with sheds coming in second at 38%, chaff cutters at 33%, weighing balances at 31%, and live livestocks at 25% of farms. Less than 15% of farmers claimed to have received assistance from the project. This may be due to the closure of the project in 2023. Even though the treatment private farms had far less access to services and production assets in 2023, their numbers are still much greater than those of the control private farms.

Among the beneficiary individual households surveyed under Call-I&II implemented individually, 92% of them reported that they are satisfied (female: 89.5%) with project's supports in terms of timeliness, relevancy and effectiveness, as against the baseline value of 66%. Of them majority of households (38.5%) were highly satisfied, 27% each satisfied and moderately satisfied in 2023. Only 3% of respondents were dissatisfied, compared to 0.72% in the baseline.

Of the total POs surveyed, 89% of the POs reported that they are satisfied by the project's services, which in 2021, 75% of the POs were satisfied. Out of the 89% level of satisfaction in 2023, 32% were highly satisfied, 25% satisfied and 32% were moderately satisfied in terms of timeliness, relevancy and effectiveness of the project's services. However, 4% of them were moderately unsatisfied and about 7% were unsatisfied from the project's services in 2023. The percentage of unsatisfied were high (7.25%) in 2023 as compared to baseline (0.73%).

In case of private farms, in 2023 87% of them said they were satisfied with the services provided by the project, with 36% saying they were highly satisfied, 23% expressing satisfaction, and 28% expressing moderate satisfaction. But in 2023, 5% expressed moderate dissatisfaction and 8% expressed dissatisfaction with the project's services.

The cost of production per liter of milk at individual household, PO and Private farm level under Task-2 in 2023 were estimated to be Rs. 32.83, Rs. 44.83, and Rs. 80.56 respectively. Whereas, the cost of production per liter of milk at control POs and Private farm levels were Rs. 59.68 and 48.51, respectively. Profit per liter of milk in individual household, PO and Private farm level under Task-2 in 2023 were estimated to be Rs. 34.17, Rs. 9.74, and Rs. 2.02 respectively. Whereas in control POs and Private farms, the profit per liter were estimated to be Rs. 16.79 and Rs. 18.28, respectively.

Similarly, the cost of production per Kg of goat meat (on live weight basis) in individual household, PO and Private farm level under Task-2 in 2023 were estimated to be Rs. 216.17, Rs. 157.65 and Rs. 258.78, respectively. Whereas, the cost of production at control POs and Private farm levels were Rs. 434.75 and 245.99 respectively. Profit per kg of goat meat (on live weight basis) in individual household, PO and Private farm level under Task-2 in 2023 were estimated to be Rs. 331.92, Rs. 377.47, and Rs. 363.10 respectively. Where as in control POs and Private farms, the profit per kg of goat meat (on live weight basis) were estimated to be Rs. 88.59 and Rs. 422.66, respectively.

The individual households under Call-I&II's dairy business were determined to be more profitable than the PO level, which is considered to be moderate. On the other hand, the private dairy farms that were put into place under Call-III were found to be inefficient in terms of turning a profit. This is because the larger investments made in buildings, machinery, and other equipment resulted in higher fixed costs, and the same investments were made in feed, fodder, and other working capitals, which increased production costs and reduced profit margins. Since these farms are only being implemented for a year, the expense will primarily exceed the return. On the other hand, the control POs and private farms were found moderately efficient in profit making as they did not invest more capital in their businesses and run as usual.

Goat enterprises managed by private farms, POs, and individual households were shown to be quite profitable. This is as a result of significantly lower spending on concentrate feed and fixed capital investments. While the control POs were shown to be comparatively less efficient than other kinds of sub-projects, the control private farms were also seen to be similarly lucrative.

It was found that the livestock enterprises implemented through the Call-I&II and run individually, could generate 3.96 person years of employment per household, including paid and family labour, compared to 2.4 person years in the baseline year (2021). The individual livestock enterprise employed a total of 2.36 person years for family labor and 1.59 person years for paid labor. The result of employment also showed a decrease in women's drudgery in livetock business from 52.36% in 2021 to 46.17% in 2023.

Together, the livestock enterprises created by PO under the Call-I&II may produce 13.91 person years of employment (Rs. 2.887.716) per PO, comprising both hired and family labor, compared to 14.4 person years per PO in the baseline year (2021). There were 2.36 person years of family labor and 1.59 person years of paid labor engaged by livestocl enterprises at the PO level. Between 2021 and 2023, family labor in PO fell from 9.1 to 7.02 person years, while hired labor climbed, going from 1.3 to 6.89 over the same years. This shows that even though there was a decline in total labor employment at the endline, the PO switched from family labor to hired labor, providing hired laborers with additional job options. The employment results also showed that, in the case of family labor, women's drudgery in

livetock businesses has decreased (from 50% in 2021 to 47.33% in 2023), while women's hired labor has increased (from 44% to 51% at the PO level).

The livestock enterprises implemented through the Call-III, implemented by Private Farms, could generate 4.92 person years of employment per Private Farm (Rs. 1.021,392), including both family and hired labour, which was 5.06 person years per Private Farm in the baseline year (2021). The amount of labor required on each farm may have decreased as a result of the adoption of innovations and climate-smart technologies. The number of workers employed by private livestock farms in 2023 was 2.18 for family workers and 2.74 for part-time contracted labor. Between 2022 and 2023, the number of family workers on private farms fell to 2.77 from 2.18, while the number of hired workers climbed from 2.29 to 2.74 in the same years. This shows that although the overall labour employment decreased in endline, the Private Farms shifted the family labour to hired labour, giving more employment opportunities to the hired labours. The result of employment also showed that women's drudgery in livetock business has been reduced from 46% in 2022 to 42.5% in 2023.

The employment generation among the control POs were observed much lesser (4.97) as compared to the treatment POs (13.9) in the year 2023. However, proportion of female employment is lesser in treatment POs (49%) as compared to the control POs (53.5%), showing lesser drudgery on women in treatment POs as compared to the control POs.

In 2023, 4.92 person years of employment could be generated per private farm by the livestock enterprises implemented through Call-III, while only 3.56 person years of employment could be generated in the control private farms. This indicates that the treatment private farms are providing more employment opportunities than the control private farms. The treatment private farms were found giving more employment opportunities for both family and hired labours. The proportion of women employment were seen more or less similar in both treatment (42.5%) and control private farms (43.3%) in 2023.

According to the obligatory provision of the productive alliances that had to be completed for subproject execution under Task-2, which were extremely low in case of treatment POs and private livestock farms, 100% of individual farmers, POs, and private farms had written agreements with the bayers. Verbal agreement, however, was also evident in the sub-projects, where 51–84% of farmers, POs, and private parties were verbally linked with traders.

It was found that, on average, the individual families under Call-I &II were able to earn Rs. 866000 annually, with the sale of three key livestock commodities from their livestock farms accounting for the most amount of earnings (Rs. 354000, or 41% of the overall revenue). The grants that government and non-government institutions received were said to be the second-largest contributing source, accounting for 14% of the total. 20% of the total household income under Task-2 (Call-I&II), when executed individually, came from the sale of FYM and other agricultural commodities.

In 2023, it was projected that the average annual revenue for individual POs, collective POs, and private farms would be 9.4 million, 14.09 million, and 10.1 million, respectively. The income levels of the treatment institutions were found to be considerably greater than those of the control institutions. The individual PO, collective PO, and private farm income levels were found to be Rs. 3.3 million, Rs. 3.99 million, and Rs. 3.97 million, respectively. In treatment and control facilities, the revenue from the sales of three primary livestock commodities accounted for more than 90% of the total. However, the income made from three major livestock commodities by treatment institutions were significantly higher than that of the control institutions.

A little over 39% of the treatment facilities were able to obtain loans, with grants coming in second at 35%, and 26% investing from their equity. In contrast, the private farms and control POs previously

used more equity—88% and 51%, respectively. In the past, 49% of private farms under ownership utilized loans to grow their operations. The grant portion at the control POs and private farms were zero or negligible.

Most dairy farmers under Call-I&II used to use green forage (83%), concentrate feed (78%), and dry forage (74%). Goat rearing farmers were also found using more green forage (86%), followed by concentrate feed (81%), and dry forage (48%). Almost all Chyangra rearing farmers used to use green forage and dry forage, followed by concentrate feed and hay/silage (27%). Milking machines were employed by 4–18% of dairy businesses in the treatment institutions, compared to none or very few in the control institutions. The second invention in dairy farming was the milking parlor, which was utilized by a very small percentage of farms for both treatment and control purposes. The percentage of urine collected in livestock farms was much higher than in treatment farms, ranging from 37 to 59%, and 14 to 50% in control farms. Cow mats were also found commonly used innovation in the dairy farms.

Individual households and private farms operating under treatment facilities were shown to be implementing more social and environmental safeguards than POs. When it came to implementing these safety precautions, the treatment POs were found to be more effective than the control POs. Contrarily, it was found that the control private farms used greater social and environmental safeguards than the treatment private farms.

Most Task-2 households were found receiving market price information from their groups and cooperatives just like Task-1 households did. Specifically, 77% of the households under Task-2 (Call-I&II), used to receive market price information from their groups and cooperatives, which in dairy 77%, goat 74%, and highest was in Chyangra rearing farmers (95%). The second source of market information for individual livestock rearing farms was from the buyers and traders.

Most member farmers were found satisfied with the technical training, business training, nursery management, and marketing services provided by their POs. About 92% of the beneficiary individual households under Call-I&II subprojects (Task-2) were found satisfied with the project (NLSIP)'s services as reported in the year 2023, in terms of timeliness, relevancy and effectiveness of the project's services. However, 4.5% were moderately unsatisfied and 3.2% were unsatisfied. About 89% of the beneficiary POs were found satisfied with the project (NLSIP)'s services as reported in the same year, in terms of timeliness, relevancy and effectiveness, relevancy and effectiveness, relevancy and effectiveness of the project's services. However, 4.0% were moderately unsatisfied and 7.2% were unsatisfied. About 87% of the beneficiary Private Farms under Call-III subprojects (Task-2), which were implemented in 2022, were found satisfied with the project (NLSIP)'s services as reported in the year 2023, in terms of timeliness, relevancy and effectiveness of the project's services. However, 4.7% of them were moderately unsatisfied and 8.1% were unsatisfied.

**In conclusion**, the project has produced remarkable outcomes in terms of reaching families, raising sales values, boosting productivity in three commodities that are part of the value chain, promoting climate-smart technology, and raising the degree of beneficiary satisfaction. It has been successful in achieving its objectives and has benefited the intended recipients. For individuals who are directly impacted by the initiative or the intended receivers, it has resulted in positive improvements or benefits.

The project has successfully reached to 191,665 households, which accounts for 95.8% of the targeted households. The project has established partnerships with financial service providers such as banks and insurance companies, which eventually contributed to success in providing production and processing assets and services to the project beneficiaries. The project has made remarkable achievements in improving the commodity productivity compared to its initial targets. The project has contributed in substantial increment in sales values within the milk and goat meat value chains. The project has

successfully promoted the climate-smart agricultural technologies among beneficiaries which eventually contributed to increased production and productivity. About two third of the project's beneficiary households showed their high levels of satisfaction and even higher percentage with the project grantees. These achievements have shown that the NLSIP project has effectively addressed multiple aspects of livestock and agricultural development, including productivity enhancement, value chain development, technology adoption, and uplifting of overall beneficiaries' well-being. The project's success can be attributed to its strategic partnerships, targeted interventions, and the positive impact it had on the livelihoods of project beneficiaries.

The project did, however, encounter several problems and difficulties during implementation, including the following: (i) it was not possible to invest in the private sector simultaneously; (ii) there was a delay in the release of installments; (iii) only forward linkages were established; (iv) there was very little support provided to POs under Component B; (v) the effects of Covid-19; and (iv) a relatively weak project database and monitoring and tracking system.

Key lessons learnt were how producers may efficiently meet their financial demands through collaboration with financial institutions and how creative interventions can raise production volumes and productivity. Therefore, it is advised that future programs and projects of a similar nature take into account the following factors: a robust M&E system; the creation of forward and backward links among value chain actors; the mobilization of the private sector; the establishment and operation of community livestock extension service centers for service delivery; the development of production pockets and clusters; the emphasis on export-quality production and connections with exporters; the institutionalization of project strategies, lessons learned, and outcomes; and the completion of a social audit of the sub-projects executed.

### **CHAPTER-1: BACKGROUND**

#### 1.1. Context and the NLSIP Project

#### 1.1.1. Introduction

Livestock production is a vital aspect of Nepal's rural economy and livelihoods, providing not only food security but also employment opportunities for the rural population. With the rise of urbanization, increased income levels, and changing food preferences, there has been a growing national demand for milk, meat, and other livestock products, thus creating opportunities for the sector's growth. To enhance the production and productivity of milk, meat, and pashmina and increase the income of producer farmers, Nepal Livestock Sector Innovation Project (NLSIP) is being implemented by the Government of Nepal's Ministry of Agriculture and Livestock Development (MoALD) with support from the World Bank (WB). The project, whick was implemented from February 2018 to June 2023, was expected to attract private and public sector investment in livestock-related businesses and services by investing in innovative support programs such as service delivery, access to information, technology, market development, and competitive enterprise development.

Moreover, the NLSIP mobilizes financial resources and promotes safeguard measures through its activities to ensure sustainable livestock production. Overall, the project aims to contribute to the growth of the livestock sector in Nepal by promoting innovation, improving productivity, and increasing incomes for producer farmers.

**Feature of the Project:** Implementation of Productive Alliance Development, which aims to improve market linkages and making them more effective, is a key aspect of the NLSIP. This feature of the project was expected to help meet the national demand for livestock products and promote the development of value chain linkages. Additionally, the project sought to scale up innovative practices and raise awareness about nutrition and food safety. Another important goal of the project was to reduce greenhouse gas emissions by promoting climate-smart livestock husbandry practices. To this end, the project has designed activities that focus on reducing the environmental impact of livestock production while ensuring its sustainability. The details of the feature of the project is given in **Figure 1**.

Development Objectives: The Nepal Livestock Sector Innovation Project (NLSIP) has set its development objective as to increase productivity, enhance value addition, and improve climate resilience of smallholder farms and agro-enterprises in selected livestock value-chains in Nepal. This project has four components. 1) The first component, Strengthening Critical Regulatory and Institutional Capacity, aims to focus on strengthening the ability of the Ministry of Livestock Development (MoLD) and its agencies at the regional, Municipality and village levels, to develop/modify and enforce a policy and regulatory framework that strengthens the livestock sector. It has the following three subcomponents: (i) Policies and Regulatory Framework; (ii) Institutional Strengthening; and (iii) Establishing Livestock Management Information System. 2) The second component, Promoting Sector Innovation and Modernizing Service Delivery, aims to enhance the capacity of key stakeholders along the selected livestock supply chains to develop, disseminate and adopt best practices. It has the following three subcomponents: (i) Support to Producers' Organizations; (ii) Modernizing Service and Input Provision Systems; and (iii) Strengthening Farmers' Training and Extension Services. 3) The third component, Promoting Inclusive Value Chains for Selected Livestock Commodities, seeks to develop a more commercial-oriented approach for selected livestock subsectors and to contribute to import substitution (for dairy products and goat meat) and export promotion (for Chyangra cashmere) by improving the productivity and value addition within the targeted value chains.

It has the following two subcomponents: (i) Development of Productive Partnerships (PP); and (ii) Financing Livestock Value Chains. **4) The fourth component,** Project Management and Knowledge Generation, aims to support project implementation activities, including operating costs of the Project Management Unit (PMU) mapped to the MoLD Secretary's office and will be responsible for ensuring that project activities are implemented in line with the provisions in the official project documents.

#### **Project Features:**

 Project Name: Nepal - SOUTH ASIA- P156797- Nepal Livestock Sector Innovation Project (IDA Credit No. 6149-NP)
 Implementing Agency: GoN/ Ministry of Agriculture and Livestock Development
 Approval Date: December 7, 2017
 Total Project Cost: US\$ 115.00 million
 Closing Date: June 30, 2024

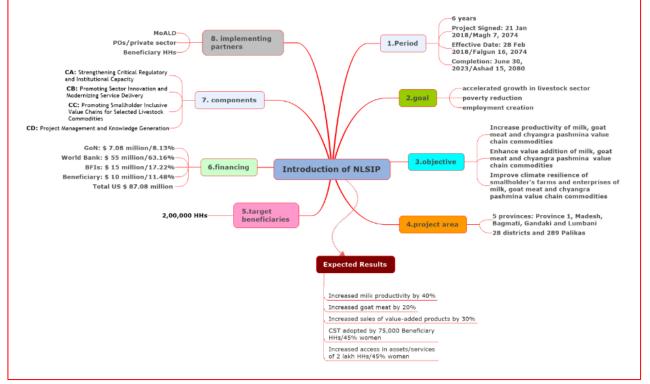

Figure 1: Introduction of NLSIP

The project was expected to support the country's priorities aligned with the four strategic pillars of the Agriculture Development Strategy (ADS): governance, productivity, commercialization, and competitiveness. The project has also taken into account the findings and recommendations from the Performance of Veterinary Services (PVS) pathway reports of Nepal's veterinary sector. The NLSIP's aim is to promote innovation, modernize service delivery, and create inclusive value chains for selected livestock commodities. In doing so, it was expected that the project will support the social and economic development of Nepal and raise the productivity and competitiveness of the livestock sector.

**Key Performance Indicators (KPIs):** The Project aimed to achieve the following Key Performance Indicators (KPIs):

**KPI -1:** Productivity of targeted livestock commodities (*milk and milk products, goat meat, Chyangra fiber*) measured through percentage increase of average (i) milk production per cow/buffalo; (ii) off-take rate expressed as carcass weight for goats, and (iii) increase in Chyangra fiber (cashmere) production.

**KPI -2:** Increased sales of value-added products in targeted value chains, measured through an increase in production output processed and marketed in the dairy, goat meat, and Chyangra Pashmina (cashmere) value chains.

**KPI -3:** Farmers adopting climate-smart agricultural technology (of which 45% are female). The number of target farmers, including female farmers, adopting improved practices and technologies promoted by the project will be used to measure this indicator. The corporate results indicator will be measured as adopting improved agricultural technology in the livestock sector.

**KPI -4:** Farmers reached with agricultural assets or services (of which 45% female). The cumulative number of farmers, including the share of women, and small and medium entrepreneurs, who benefit from one or more project activities, will be used to measure this indicator. The corporate results indicator will be measured as farmers reached, agriculture assets, or services.

#### 1.1.2. Geographic Coverage and Beneficiaries

The project's implementation was centered on Nepal's physiographic diversity, which included mountains, hills, and Terai plains. The project was implemented through four Decentralized Level Support Units (DLSUs), which served as cluster-level offices to assist this. Each cluster comprised local governments (municipalities and rural municipalities), producers' organizations, entrepreneurs, and consumers. These clusters covered 289 municipalities in 28 districts across five provinces and were home to a population of 12.4 million (including 6.4 million females). The project's decentralized approach ensured that it could effectively reach and engage with a broad range of stakeholders in different geographical locations, promoting inclusiveness and equity in its implementation.

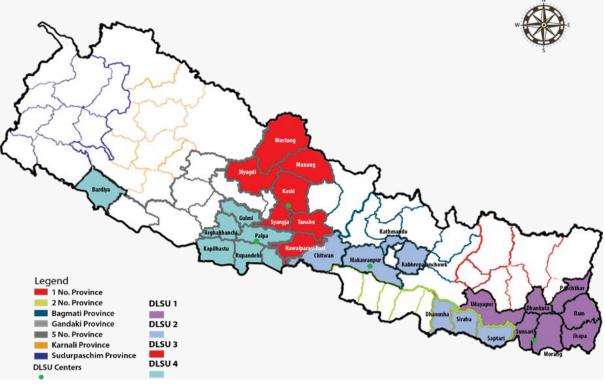

Figure 2: Overall Coverage Map of NLSIP

#### 1.1.3. The NLSIP Project Implementation Approach

The Nepal Livestock Sector Innovation Project (NLSIP) employed a value chain development approach to increase productivity and competitiveness in the livestock sector. Among the livestock commodities, the project targeted three priority livestock value chains: Dairy, Goat Meat, and Chyangra Pashmina. The application of cluster approach in project implementation was applied to enabled stakeholders'

engagement with the aim of maximizing the efficiency of service delivery and to produce the impact at scale by maximizing synergies. The primary project beneficiaries would be 200,000 livestock producers, with at least 45% of them being women, and 500 small and medium-sized agro-entrepreneurs. In addition, the project was supposed to provide matching grants to 601 agro-enterprises as production and post-production value chain support. The Producer's Organizations (POs) were required to propose the selected business plans, which were evaluated and financed through a combination of IDA-financing (maximum 50% or Nepalese Rupees-NRs 10 million), a cash contribution (minimum 20%) from the POs, and a mandatory loan (minimum 30%) from a participating Bank and Financing Institution (BFI).

The NLSIP has applied a rigorous three-step selection process to identify eligible applicants for matching grants. The process included screening of Project Concept Notes (PCNs), field verification, and Full Project Proposal (FPP) evaluation. The project utilized a milestone-based grant payment system, where grant installments were released to grant recipients only after the completion of agreed milestone activities that have been appraised and verified.

#### 1.1.4. Project Implementation Arrangement of NLSIP

The Nepal Livestock Sector Innovation Project (NLSIP) was implemented by the Project Management Unit (PMU) under the Ministry of Agriculture and Livestock Development (MoALD). The PMU was established on July 11, 2018, at the Department of Livestock Services (DLS) complex in Lalitpur, and was headed by a Project Director. The PMU operated through four Decentralized Level Support Units (DLSUs) located in Biratnagar, Hetauda, Pokhara, and Butwal, each led by Senior Livestock/Veterinary Officers. Additionally, the National Livestock Breeding Office (NLBO) in Pokhara, which is the apex organization for livestock breeding in Nepal, had been assigned to lead breeding-related activities and had been included as an additional cost center since fiscal year 2020/21. The Project has established several committees to provide guidance and support at different levels.

The Project Steering Committee (PSC) was established on May 18, 2018, chaired by the Secretary of MoALD, provided overall strategic guidance to the Project. The Technical Coordination Committees (TCC), chaired by the Director General of the Department of Livestock Services (DLS), supported the Project on technical matters. At the field level, Provincial Level Coordination Committees (PLCCs) had been established at the cluster level to ensure coordination and support. These committees were headed by the respective Secretaries of the provincial Ministries of Land Management, Agriculture, and Cooperatives (MoLMAC). The Project Steering Committee (PSC) was composed of representatives from various government line agencies, civil society groups, and farmer organizations. This committee included Joint Secretaries from MoALD, NPC, and MoF, as well as Director Generals from DLS, DFTQC, ED of NARC, and the Department of Cooperatives, among others. The Member Secretary of the PSC was the Project Director of NLSIP. The PSC convened quarterly to endorse the project's annual work plan and budget, monitored the progress of NLSIP, provided oversight and policy direction, and resolved any outstanding issues. In the reporting period, the PSC met twice and made significant decisions, such as approving the Project Implementation Manual (PIM) and establishing DLSUs in four different locations.

The PMU was led by a Project Director (GI level) with a competent team of experienced and qualified staff. The PMU was also supported by experts from various fields. The PMU was responsible for the overall management and implementation of the project, which included fiduciary, environmental, and social safeguards, communication, monitoring and evaluation (M&E), and reporting. It also provided guidance and assistance to the DLSUs to carry out their assigned tasks. The PMU was supported by four additional Decentralized Level Support Units (DLSUs) as separate cost centers that were

established on May 03, 2018. One DLSU was situated in each of the four provinces and covered a total of 289 municipalities in the selected clusters. On an average, each DLSU served about 60-70 municipalities. The National Livestock Breeding Office (NLBO) in Pokhara had been included as a new cost center and was responsible for all breed improvement-related activities. The command districts and municipalities for each of the DLSUs under the NLSIP have been presented below in Table 1.

| Geographic coverage |  | Component A      | Component B     | Compone     | Component C         |                |  |
|---------------------|--|------------------|-----------------|-------------|---------------------|----------------|--|
|                     |  | Country-wide     | Country-wide    | All         | municipalities      | in project     |  |
|                     |  |                  |                 | districts/c | lusters based on ag | greed criteria |  |
| No. of Distri       | cts  | 77               | 77              | 28          |                     |                |  |
| For Component C     |  |                  |                 |             |                     |                |  |
| Province            | Districts  |                  |                 |             | Total               | Location of    |  |
|                     |  |                  |                 |             | municipalities      | the DLSUs      |  |
| Province 1          | Panchthar, Ilam, Jhapa, Dhankuta, Udayapur, Morang |                  |                 |             | 77                  | Biratnagar     |  |
|                     | and Sunsari  |                  |                 |             |                     |                |  |
| Madhesh             | Saptari, I   | Dhanusha and Sir | aha             |             | 53                  | Hetauda        |  |
| Bagmati             | Kavrepalanchowk, Kathmandu, Makawanpur, and        |                  |                 |             | 1 41                |                |  |
|                     | Chitwan  |                  |                 |             |                     |                |  |

#### 1.2. The Present Assignment of NLSIP Endline Survey

The current task involved gathering and analyzing primary data to assess the project's impacts, effectiveness and outcomes. The project aimed to enhance climate-smart livestock production and sales in three value chain commodities -- milk, goat meat, and Chyangra pashmina -- among beneficiary households. The project implemented its interventions through government institutions and provided direct investment to producers, collectors, and processors through sub-projects with a 50% grant support modality. The project conducted a baseline survey in 2020 and annual surveys in 2021 and 2022 to evaluate the progress of the project interventions vis-à-vis the anticipated outcomes as outlined in the Project Appraisal Document (PAD) and the project results framework. The current task involved gathering valid and reliable primary data and generating a detailed endline survey report, which would compare the endline data with the baseline, and intermediate results as well.

#### 1.2.1. Rationale of the NLSIP Endline Survey

Component "A" of the project focused on policy development and the creation of Acts related to livestock. Component "B" aimed to promote innovation in the sector and modernize service delivery. This included activities such as forming and mobilizing producer organizations (POs) such as farmer groups and cooperatives, providing livestock health services, conducting genetic improvement activities, developing feed bases, promoting climate-smart livestock practices, building the capacity of staff and farmers, and implementing infrastructure development civil works. Component "C" dedicated in providing matching grant supports to selected livestock enterprises in the milk, meat, and pashmina sectors. As the project scheduled to be phased out by June 2023, conducting an endline survey was

necessary to assess the impact of the project's interventions at the households, POs, and sub-project levels.

#### 1.2.2. Objective of the NLSIP Endline Survey

The main objective of the endline survey was to evaluate the impact of project interventions on beneficiary households and sub-projects.

The endline survey aimed to achieve three goals:

- a) Collect socio-economic data from sampled POs and project beneficiary household;
- b) Provide data relevant to the project result framework indicators to measure the project's effectiveness and impact; and
- c) Propose recommendations to enhance the effectiveness of similar future projects.

The consulting firm was assigned to evaluate two separate tasks to measure (i) the impact of the overall project interventions, and (ii) the impact of matching grant supports, which are outlined as follows:

**Task-1: Overall Project Impact Evaluation:** The purpose of the survey was to measure changes in PDO indicators in the Results Framework (productivity and sales of value-added livestock commodities) and attribute those changes to the project.

**Task-2: Matching Grant Impact Evaluation:** The survey's objective was to measure how the project's matching grant—which is included in component "C"—was affecting the grantees. In particular, the impact on the matching grant recipients—including the productivity and performance of agribusinesses throughout the final four years of the MG Sub-project implementation—was assessed by descriptive analysis of changes in key project indicators.

#### 1.2.3. Limitations of the NLSIP Endline Survey

The consulting firm, as per the contract agreement with the NLSIP, applied its full effort in completing the endline survey 2023. However, the suvery had some limitations and the survey team had to face some challenges, which are listed as follows:

- 1. Limited time allowed for field data collection: As much of the time was consumed for finalizing the data collection tools and techniques from the part of the Project, the time for field data collection was limited.
- 2. Changed Contact numbers of beneficiary sub-projects: As the project has not updated the contact mobile number of the beneficiary sub-projects, the study team faced difficulties to find out the sub-projects. As a result, more time consumed for contacting them.
- 3. **Contact number of sub-projects were not available:** Most of the sub-projects' contact number were not updated by the project, because of this the survey team could not find all the sub-projects.
- 4. **Reluctancy of sub-projects to provide data:** Even the grant recipients who had poor performance of the sub-project were reluctant to provide data. Because of this, full data/information from such types of sub-projects could not be collected.
- 5. **Data collection from Control sub-projects:** As the project provided the list of control sub-projects which were not awarded the grant but submitted their business proposals to the project, the survey team had to face much problems to collect data from most of such control sub-projects, and complete data could not be collected.
- 6. **Data collection from Call-III:** As the sub-projects implemented in later phase of the project (2022/23) under Call-III, these sub-projects were also reluctant to provide the data to the survey team.
- 7. **Missing Beneficiary Names in the community:** Most of the name list provided by the project under Task-1 were not found in the community.

8. **Coordination during data collection:** It was difficult to collect data from the beneficiaries as their perception regarding project was very high, and most of the beneficiaries were not coordinated with the consulting firm, and hence it was difficult to collect the data.

# **CHAPTER-2: ENDLINE SURVEY METHODOLOGY**

# 2.1. Survey Design and Methodology

This study employed a mixed-methods approach, collecting data from primary and secondary sources, using both quantitative and qualitative research methods. Primary data were collected through a household survey of beneficiary households and sub-projects related to the dairy, goat meat, and Chyangra Pashmina value chain commodities. Secondary data were collected by reviewing relevant project documents. Specifically, the endline study followed the following methodologies:

- Review of project documents for secondary data collection
- Consultations with NLSIP/PMU/DLSUs and other concerned stakeholders
- Application of quantitative and qualitative data collection tools for primary data collection.

# 2.1.1. Sample Design

The sampling plan as designed by the NLSIP project was used. The project applied a purposive sampling design to select POs and households. As recommended, a sample size of 1505 HHs were selected, which included all POs that were surveyed during the baseline in 2020, as well as those surveyed in both HHS1 (2021) and HHS2 (2022), and POs that were only surveyed in either HHS1 or HHS2.

# 2.1.2. Sampling of Households

The NLSIP provided a list of selected farmer groups and cooperatives, as well as sub-projects. Therefore, the survey team selected 1505 households<sup>1</sup> for task 1 and 1064 households<sup>2</sup> for task 2 using a simple random sampling method from the household list of selected POs' household lists. Additionally, the team selected all 449 sub-projects, which were supported by the project, with a focus on evaluating impacts of the matching grants. To collect qualitative data and information, the team conducted 29 key informant interviews, 8 individual interviews, and 8 focus group discussions. To serve as control sub-projects, an equal number of sub-projects (449), were also planned to be interviewed, but only 179 farms (32 POs and 147 private farms) could be interviewed. Table 2 and 3 below provides the details of the sampling target and achievement, and **Annex 6** provides the list of selected POs and sub-projects.

| Tools  | Target of<br>POs/ SPs<br>selection | Achievement<br>of POs/SPS<br>selection | Target of<br>Sampling<br>HHs | Progress of<br>Sampling<br>HHs | Purpose of sampling   |  |

# Table 3: Detail Number of KIIs, FGDs, and Individual Interviews

Sounce: Endline Survey of NLSIP, 2023

A value chain and district level sample distribution was prepared based on the POs and SPs (treatment and control) provided by the project. Under the HH Survey Task 1, a total of 486, 679 and 17 sample households were interviewed for milk, goat meat and Chyangra Pashmina value chains respectively. Similarly, under HH survey Task 2, a total of 503, 486 and 64 households were interviewed for milk, goat meat and Chyangra Pashmina value chains respectively. As a result, a total of 989, 1165, and 81 households were interviewed for HH survey for milk, goat meat and Chyangra Pashmina value chains. Similarly, interviews were conducted with all 449 sub-projects for treatment, while only 179 POs and Private Farms could be interviewed as part of an institutional survey. The reason for the lower number of interviews with the control sub-projects is that the producers' organizations (POs) were reluctant to provide information because they had not received the project's grant. The value chain-specific details of sampling and survey of HHs and Sub-projects/POs completed are provided in **Tables 4 and 5** below.

| Value Chains       |        | alue Chain-<br>HHs Survey | wise detai | details of survey completed<br>Institutional Survey |         |       |       |
|--------------------|--------|---------------------------|------------|---|---------|-------|-------|

 Table 5: Value Chain-wise details of Institutional Survey completed

Sounce: Endline Survey of NLSIP, 2023

# 2.2. Designed Survey Tools and Data Collection

### 2.2.1. The Survey Tools

Three sets of semi-structured questionnaires were employed to collect data, including:

- Structured household survey questionnaires (Task 1 and Task 2) for quantitative survey
- Structured questionnaires for institutional survey of sub-projects, and also for quantitative survey
- Checklist of Key Informants' Interviews (KIIs) for qualitative survey
- Checklist of Focus Group Discussions (FGDs) for qualitative survey
- Questionnaires for Individual Interviews (IIs)

The team worked closely with the project team during the survey instruments development, which included household questionnaires for Task 1 and Task 2, institutional survey questionnaires, key informants' checklists, individual interview questionnaires and focus group discussion checklists. The team also held consultations with project teams and officials and discussed on the survey tools and methodology. Data was collected using the revised household survey checklists and questionnaires, which had been updated to include NLSIP's feedback and recommendations.

# 2.2.2. Developed Online Form

The questionnaires were designed online form using the KOBO Toolbox and the data were stored online at www://kobo.humanitarianresponse.info.

# 2.2.3. Organized Training for Supervisors and Enumerators

A training program for eight days (14 June to 20 June 2023) was conducted for supervisors and enumerators to enhance their ability to collect data from beneficiary households and sub-projects. The training covered topics such as tools, computer applications (KOBO), data collection and tracking, guidelines, and knowledge of overall project interventions and progress to date.

# 2.2.4. Developed Online Data Tracking Mechanism

A mechanism for online tracking of data was designed to ensure high-quality data collection process. The data management expert supervised the overall data tracking process, and two data checkers reviewed the data daily after the enumerators synchronized them from the field. Project staff, including the Project Management Unit (PMU), Decentralized Level Support Unit (DLSU), and World Bank also had access to view the data collection process. Figure 3 shows the details of the online data collection tracking mechanism, which was applied for quality assurance of data and its collection process.

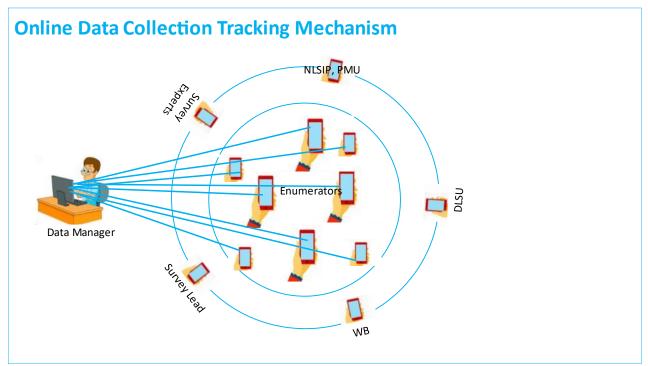

Figure 3: Online data tracking mechanism applied in NLSIP Endline Survey, 2023

# 2.2.5. Data Collection Process

Proficient staff members (supervisors and enumerators) were deployed to collect initial data from the households and POs. The team leader and other experts conducted key informant interviews. The structured questionnaires were coded in the Open Data Kit (ODK) platform using the KOBO Tool Box software. The survey questionnaires were designed in English, which were then translated to Nepali language in the KOBO. However, the field supervisors and enumerators could also use English version, wherever needed. The following steps were taken to ensure reliable data collection during the endline survey:

- 1) Developed a questionnaire in English and translation to Nepali language;
- 2) The structured questionnaires were uploaded into Android tablets, which were used by enumerators and supervisors;
- 3) The questionnaires were tested in the field;
- 4) Seven-day orientation sessions were conducted to familiarize enumerators with the project objectives and data collection tools;
- 5) Peer practice sessions held to ensure that enumerators are familiar with digital data collection procedures;
- 6) A one-day field practice was conducted to check the survey questionnaires and gain a better understanding of field scenarios under similar conditions;
- 7) The questionnaires were then updated, based on the comments and sugessions received from the field practice session, and used for the final survey;
- 8) The enumerators collected data from the field and uploaded into the system on the same day, whenever possible;

- 9) At the central level, a team supervisor, reviewed each uploaded data daily. If there were any confusion or mistake, the supervisor contacted the enumerator to clarify the issue or correct immediately, or ordered for a resurvey of the households, if necessary;
- 10) An expert team also visited the field during the survey to cross-check the survey process conducted by the enumerators in the sites. They also provided suggestions and instructions to the enumerators;
- 11) The expert team conducted key informant interviews, focus group discussions, and individual interviews.

### 2.2.5.1. Data Collection at the Household Level (1182 households)

To assess the overall impact of the project, the consulting firm surveyed around 1182 households from the 74 selected POs across 28 NLSIP districts.

- The list of the 74 selected POs were provided by the project. If a selected PO was not available in the community, an alternative PO in the same district and the same value chain commodity were selected after consultation with respective DLSU.
- A total of 856 households were interviewed which overlapped in the baseline survey 2020, AHH survey 2021, and AHH survey 2022. The remaining 667 households were selected by using a simple random sampling method from the selected POs list provided by the project for interview.
- If a sampled household was not available or household head/household respondent was not available in two attempts, that household was replaced by another HH within the same PO and same value chain commodity, in consultation with respective DLSU.

### 2.2.5.2. Data Collection at the Household Level (1053 households) for Matching Grant Evaluation

The project has implemented a total of **213** sub-projects under Call 1 and 2, out of which **121** were implemented individually with more members in each sub-project handling it independently. The remaining **92** sub-projects were implemented by a group of members working under one umbrella (more than one member in one place). For evaluating the matching grant at the household level, 1053 households were interviewed from the 121 sub-projects of Call I and Call II. The survey team (enumerator) used a simple random sampling method to select 1053 households for interviews from the list of beneficiary households within the 121 sub-projects. The enumerators were trained on about random sampling method and process during the enumerators' training.

### 2.2.5.3. Institutional Survey at Sub-Project Level

The project has implemented a total of 326 sub-projects under call-3, which are being operated by private firms and companies. As part of the institutional survey, the consulting firm collected the data from a total of 449 sub-projects, including 196 sub-projects from call 1 and 2, and 253 sub-projects from call 3.

### 2.2.5.4. Institutional Survey of Control Sub-Projects

The survey team compiled the list of sub-projects that were not awarded from the business plan submissions in each of the 28 districts. The survey team interviewed a total of 179 sub-projects, which operated within the same value chain commodity in the project districts. The institutional survey in the control sub-projects was based on only limited questions which are related to production and sales of the targeted value chain commodities for comparing the impacts of the sub-project on treatment sub-projects over the control sub-projects.

### 2.2.5.5. Key Informant Interviews (KIIs)

To validate the quantitative data, the consulting firm also gathered qualitative information from project key informants during the survey period. The firm conducted interviews with a total of 29 key informants.

### 2.2.5.6. Focus Group Discussions (FGDs)

During the survey, the consulting firm conducted a total of 8 focus group discussions to gather data and information from three of the livestock marketplaces and five milk chilling centers.

### 2.2.5.7. Individual Interviews (IIs)

The consulting firm interviewed a total of 8 staff of the GoN (VHLSEC of the MoLMAC and the Livestock Service Section of Palikas) who participated in the capacity-building training during the project implementation for assessing the impact of the training provided by the NLSIP.

### 2.2.6. Quality Assurance Mechanism of Data

### 2.2.6.1. Translating the Household Questionnaires into Nepali Language

After the finalization of the English version of the questionnaires that were translated into the Nepali language with its actual meaning to maintain the quality.

### 2.2.6.2. Deployed Qualified Statistician

A highly qualified statistician was deployed to ascertain the statistical validity of the data.

#### 2.2.6.3. Well-Trained Supervisors and Enumerators

The Supervisors and enumerators were well-trained on both verbally and practically in the field so that they could gather actual field data.

#### 2.2.6.4. Field Test of the Questionnaires

The questionnaire was field tested in the Kathmandu and Lalitpur districts (22 June 2023) during the enumerators' training where representatives of NLSIP was present their feedbacks and comments were well incorporated in the final version.

### 2.2.6.5. Deployment of Monitoring Team

The experts of the consulting firm collected the qualitative data from the field by using tools: KII, FGDs, and Individual Interviews. During the qualitative data collection, the experts' team simultaneously supervised the enumerators' activities, closely reviewed the filled-up data, and mentored them instantly.

#### 2.2.6.6. Online Data Checking and Feedback at Every Moment

Each of the enumerators were provided with feedback and comments at every moment when they had any confusion or faced any problems during the data collection. The two online data checkers were deployed for online data checking purpose. The online data checkers received the data from the supervisors once the enumerators synchronized the data from the field, and verified by the supervisors. Upon receiving the data from supervisors, the online data checkers instantly reviewed the data and provided the feedback to the supervisors and the enumerators.

### 2.2.6.7. Guidelines to the Enumerators

The data collection guidelines was developed and the enumerators and supervisors were oriented on the guidelines, which helped to maintain the quality of data collection. The guidelines covered the topics mainly on the importance of data, data collection steps, sampling of households, replacement of households, replacement of POs, consultation with project teams at the field level, some codes of conducts to be followed in the field, etc.

### 2.2.6.8. Evaluation of Data

During the data collection of a certain number of households, the consulting firm and project sat together and reviewed the status of data collection and their flow of directions so that corrective actions would be taken for the quality data collection, wherever needed.

# **2.3. Data Analysis and Interpretation**

### 2.3.1. Analysis of Primary Data and Iinformation

The data were cleaned, analyzed, and presented in tables, graphs, and charts by the Statistician as per the indicator requirements instructed by the team leader and other team members. BFI performed exploratory data analysis, such as frequency counts, percentage tabulations, and cross-tabulations, on sub-group statistics and project-level statistics of important survey variables, and provided relevant interpretations.

The consulting firm calculated the sub-group statistics on PDO-level indicators as follows:

- The average of all surveyed households' values within each PO were calculated to measure indicators at the PO level.
- Sub-group statistics were provided for PDO-level indicators based on a household level, PO level, and district level, categorized by value chains.

**For Task 1**, which focused on overall impact, the firm analyzed the survey results using the result framework indicators for PDO level indicators. Task 1 under project support of component B with the beneficiary type PO members the value chain commodities in this are milk, goat meat, and Chyangra Pashmina. This mainly included the PDO indicators viz. productivity, sales, and adoption of climate-smart technology (CSA). Average productivity (e.g. milk) among households within the same PO was measured and then the average productivity among POs was measured over time to compare with Baseline 2020 in aggregate. By this way goat meat productivity and the Chyangra Pashmina productivity were measured. Similarly, for sales of milk, goat meat and Chyamgra Pashmina was measured both within PO and among POs and compared the outputs with Baseline 2020.

The number of farmers who adopted the climate-smart technology (CST) in their farms that were compared with Baseline 2020.

**For Task 2,** which focused on the Matching Grant Evaluation, for which the firm analyzed the data that included in the project's support under component C, which has three types of beneficiaries: i) Individual Sub-Project (SP) by PO/Group/Cooperative; ii) Collective SP by Group/Cooperative; and iii) Commercial SP by SME.

The individual SP by PO/Group/Cooperative's results were measured (endline) and were compared with Annual Household Survey (AHHS) 2021 and AHHS 2022. The productivity in the individual SP was measured as total output over total standing herd size animal then average productivity among

households within the same PO/Coop and then among the POs/ Coops were measured. This output was compared with AHHS 2021 and for the institutional level, it was also compared with AHHS 2022.

The PDO indicator for collective SPs by Coops could be productivity, sales, CSA-Adoption, income, and insurance done, and were compared between Control and treatment.

Similarly, for Commercial SME the PDO indicators could be productivity, sales, CSA-Adoption, income, and insurance, and were compared between the control and treatment of the commercial SPs by SMEs.

The details definition of the major PDO indicators are given in Table 4 below.

| 14                | Die 0. Deminition of Major multators al |   |  |  |  |
|-------------------|---|---|--|--|--|
| Indicators        | Definition                              | Measurement                             |  |  |  |
| Milk Productivity | Milk production in liters per livestock | Percentage increase of average milk     |  |  |  |
|                   | per year (cow and buffalo)              | production per cow/buffalo              |  |  |  |
| Goat Meat         | Offtake goat meat production            | Percentage increase in offtake rate     |  |  |  |
| Productivity      | expressed as carcass weight (kg) per    | expressed as carcass weight for goats   |  |  |  |
|                   | goat per year                           |   |  |  |  |
| Sales             | Sales of major raw products and value-  | Percentage increase of sales value      |  |  |  |
|                   | added products                          | (aggregated over all the targeted value |  |  |  |
|                   |   | chains)                                 |  |  |  |
| Income            | Household level income, PO level        | Incremental income at Household         |  |  |  |
|                   | income and commercial producer level    | level, PO level and Commercial          |  |  |  |
|                   | income                                  | Producer Level                          |  |  |  |
| Adoption          | Farmers adopting climate smart          | Percentage of Households and            |  |  |  |
|                   | agricultural technology as promoted     | Commercial producers (SME) adopted      |  |  |  |
|                   | by the project                          | climate-smart agriculture technology    |  |  |  |

Source: NLSIP Endline Survey Study, 2023

The consulting firm also compared the end-line results of the surveyed grant recipients with those who applied for the grant but were not selected, ensuring that the same numbers of non-grant recipients are surveyed. The consulting firm also cross-checked and validated the endline results with PO's records and reporting. The calculation of productivity of the milk is given below (for milk as an example).

| 1 | Pubb — <u>Total Anual milk production, liters</u>  |
|---|--|
|   | $Pyhh = \frac{Total Anual milk production, liters}{Total Standing herd animal, heads}$               |

|   |  |

with baselines.

### 2.3.2. Analysis of Secondary Data and Information

The survey team conducted a desk study and reviewed various project-related documents, including the Project Appraisal Document (PAD), Result Framework, COI Guideline, Project Implementation Manual 2019 (PIM), Environmental and Social Management Framework 2017 (ESMF), Stakeholder Dialogue Platform 2075, NLSP Financing Agreement, Grievance Redress Procedures 2075, Baseline Report, Project Documents, Manuals, Guidelines, Assessment Reports, Study Reports, CENA, Household Survey Report (s) conducted to date, and other relevant policies, frameworks, and reports. The NLSIP-supported project activities were anticipated to bring about changes in the outcome and impact indicators of the targeted beneficiaries in the short and long term. The project's policy formation and capacity development initiatives for regulatory agencies were intended to provide effective livestock services to beneficiary households and POs. The project's services and matching grant support were expected to increase production, productivity, and sales of value-added products in the targeted livestock value chain commodities such as milk, goat meat, and Chyangra Pashmina.

# 2.4. Field Activities

# 2.4.1. Team Mobilization for Field Activities

A total of 31 individuals, including enumerators (25) and experts (6), were mobilized to collect primary data from producers, collectors, processors, and service providers in 28 districts across five provinces: Koshi, Madhes, Bagmati, Gandaki, and Lumbini. These 28 districts are Panchthar, Ilam, Jhapa, Dhankuta, Udayapur, Morang, Sunsari, Saptari, Dhanusha, Siraha, Kavrepalanchok, Kathmandu, Makawanpur, Chitwan, Syangja, Kaski, Mustang, Manang, Tanahu, Myagdi, Nawalparasi-East, Rupandehi, Nawalparasi-west, Gulmi, Palpa, Arghakhanchi, Kapilbastu, and Bardiya. The team were mobilized in two phases: first covering 12 districts and second covering 16 districts. A total of 2 to 4 enumerators were deployed in each district as per number of sample sizes. The team of expert were mobilized for collecting data through KIIs, individual interviews and FGDs. The experts' team supervised and mentored the enumerators. A team of 3 persons: 2 online data checkers and 1 data manager were mobilized for day-to-day online data tracking and provided feedback to the enumerators. A total of 146 samples including HHs and SPs were covered by one enumerator, on an average. Thus, the consulting firm had made travel plan of 35 days for one enumerator including travel time. Around 5 interviews per enumerator were taken in a day. The consulting firm was primarily responsible for managing the logistics for the field team before their departure to the field.

### 2.4.2. Post-Field Activities

The following activities was carried out within the given timeframe after the field survey:

- 1. **Preparation and Submission of Draft Report:** The consulting firm completed the assigned tasks and submitted the draft report to the NLSIP on 12 July 2023. The firm also consultated and shared the findings with the relevant stakeholders before finalizing the endline survey report.
- 2. Validation Workshop for Presentation of Draft Report: The validation workshop was organized on 15 July 2023 to validate the endline survey results of the project.
- **3.** Incorporation of comments and suggestions to the draft Report: The comments and suggestions were collected from the validation workshop and incorporated in the endline survey final report.
- **4.** Final Report submitted the (5/5 sets of hard copies along with 1 soft copy) to the NLSIP. The consulting firm submitted the final report on 20 July 2023.

# **2.5. Deliverables**

The consulting firm submitted the following deliverables within the specified timeline. Additionally, ecopies of the raw data collected during the study were also submitted to the Project before the final payment was made. The firm also attached related photographs in relevant sections of the report.

| Tasks  | Deliverables                 | Copies     |
|--|------------------------------|------------|
| Inception Report/ Validation Workshop: An Inception        | Inception Report             | 2 copies   |

### Table 7: Major Deliverables of Endline Survey delivered to the NLSIP

Source: NLSIP Endline Survey Study, 2023

# CHAPTER 3: ENDLINE SURVEY RESULTS AND DISCUSSION

This chapter highlights the endline survey results of the NLSIP, which are discussed in the following sections.

# **3.1. Progress on PDO Indicators (Baseline to Endline Comparison):**

The NLSIP's Result Framework lists four Project Development Objective (PDO) indicators. The following comparison and discussion takes place between the baseline values on the PDO indicators as of 2020, the progress made in 2021 and 2022, and the values obtained on the PDO indicators from the endline survey conducted in 2023:

# 3.1.1. Productivity of Targeted Livestock Commodities

According to the NSSIP project design report, milk, goat meat and Chyangra Pashmina are the three main commodities targeted in the livestock value chain. Productivity of targeted livestock commodities is one of the important PDO level indicators of the Project-NLSIP. The productivity of milk (cow and buffalo), goat meat, and Chyangra Pashmina as found in the Endlline survey, 2023, compared with the baseline (2020) and progress as of 2021 and 2022, and are discussed in the following sub-sections.

The milk productivity per year per standing cow which was 1222 litre in baseline (2020), increased to 1232 liter in 2021, 1498 liter in 2022, and 2239 litre in 2023. Similarly, milk productivity per year per standing buffalo was 720 litre in baseline (2020), increased to 749 liter in 2021, 815 liter in 2022, and 1346 liter in 2023. The productivity of goat, measured in carcass weight, which was 7.8 kg per goat per year in 2020, decreased to 3.9 kg in 2021, increased to 5.42 in 2022, and increased to 13.48 kg in 2023.

The productivities of targeted livestock commodities compared with the baseline (2020), year-2021, 2022, and endline (2023), have been presented in the following table and figure.

|      | (2020) to Endine (2023): |                  |                |            |            |               |  |  |  |
|------|--------------------------|------------------|----------------|------------|------------|---------------|--|--|--|
|      |                          |                  | Baseline       | HH Survey, | HH Survey, | Endline       |  |  |  |
|      | PDO                      |                  | Survey, 2020   | 2021       | 2022       | Survey, 2023  |  |  |  |
| S.N. | _                        | Units            | (N=dairy: 673, | (N=dairy:  | (N=dairy:  | (N=dairy:     |  |  |  |
|      | Indicators               |                  | goat meat:     | 803, goat  | 693, goat  | 486 and goat: |  |  |  |
|      |                          |                  | 627)           | meat: 439) | meat: 760) | 679)          |  |  |  |

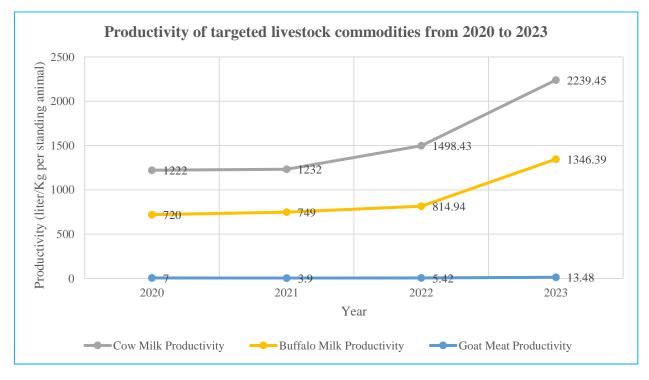

Figure 4: Productivity of Targeted Livestock Commodities from 2020 to 2023

### 3.1.2. Sales of Value Added Livestock Commodities

According to the NLSIP design report, the sales value of the three main livestock commodities--goat meat, milk, and Chyangra Pashmina--as well as their value-added products, are also the major impact indicators. Based on the endline survey results, these indicators are presented and discussed in the following sections.

Sales value of milk and milk products per household per year which was NRs. 396 thousand in 2020 (baseline) was increased to Rs. 402 thousand in 2021, Rs. 484 thousand in 2022, and NRs. 599 thousand in 2023. Most of the sales income of dairy households were from raw milk sale.

The sales value of goat meat per household, which was NRs. 56 thousand in 2020 (baseline), increased to Rs. 60 thousand in 2021, Rs. 75 thousand in 2022, and NRs. 107 thousand in 2023 (endline). Most of the sales income of goat rearing households were from sale of live goat.

The sales values of the three major livestock commodities recorded during the baseline (2020), 2021, 2022 and endline (2023) have been presented in the following table and figure.

| S.N | PDO Indicators                                   | Units                        | Baseline<br>Survey, 2020<br>(N=dairy:<br>673, goat<br>meat: 627) | HH Survey,<br>2021<br>(N=dairy:<br>803, goat<br>meat: 439) | HH Survey,<br>2022<br>(N=dairy:<br>693, goat<br>meat: 760) | Endline<br>Survey,<br>2023<br>(N=dairy:<br>486 and<br>goat: 679) |

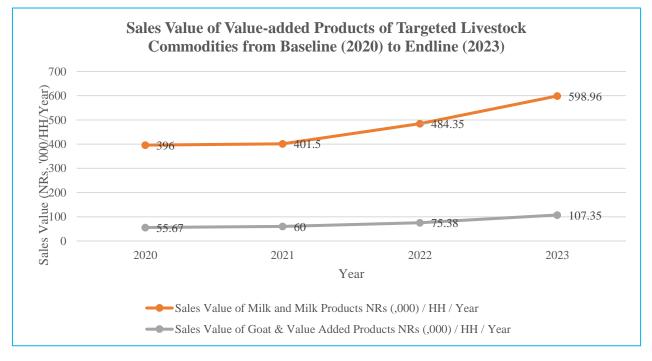

Figure 5: Sales Value of Value-added Products of Targeted Livestock Commodities from Baseline (2020) to Endline (2023)

# 3.1.3. Farmers Adopting Climate Smart Agricultural (CSA) Technology

The results regarding adoption of Climate Smart Agricultural Technology (CSAT) by farmers for all three value chains under Component B (Task 1) are presented and discussed in the sections below.

The project-NLSIP has been promoting seven types of climate smart agricultural technologies (CSATs), which farmers are using in three targeted livestock commodities. They include: (i) Improved management of the shed, (ii) Management of manure, (iii) Fodders, forage production and pasture development, (iv) Production of hay and silage, (v) Feeding of stall, (vi) Forage seed production, and (vii) Saplings/seedlings production. The CSAT used by producer farmers in all three targeted livestock commodities is highlighted in the next subsections.

Out of the seven-climate smart tehnologies, maximum (59%) farmers used to adopt improved shed management technologies, followed by manure management (46%), and fodders, forage production and pasture development (26%), and least in saplings/seedlings production (0.3%). This has been presented in the following table. These figures on the use of CSATs have positive impact on the productivity increase in the dairy and goat value chain, as mentioned above in Section 3.1.1.

| Climate Smart Agricultural Technologies               | Cooperative<br>(N=295) |       | Farmer<br>(N=8 | -     | Total (N=1182) |       |

 Table 11: Climate Smart Agricultural Technologies applied at HH level in Targeted Livestock

 Commodities in in all Value Chains in 2023

Source: Endline Survey of NLSIP, 2023

The above results as obtatained from the endline survey could not be compared with the baseline (2020), Household Survey, 2021 and 20222, as there were no numbers in each type of CSAT in those surveys.

However, an attempt has also been made to compare on the number of technologies adoption of Climate Smart Agricultural Technonogies (CSATs) in the targeted livestock commodities by the farmers from baseline (2020) to endline (2023), and the results have been presented in the following table.

|  |                           |                                       | (N=1400 HE                          |                              |                           | Survey, 2021                          |                                     |                              |                           | Imodifies from Baseline (2020) to Endline (2023)HH Survey, 2022 (N=1557 HHs)Endline, 2023 (N=1182 HHs) |                                     |                              |                           | [s)                                   |                                     |                              |

### Table 12: CSAT Applied at HH level in all Targeted Livestock Commodities from Baseline (2020) to Endline (2023)

Source: Baseline Survey, 2020; HH Survey, 2021 & 2022; and Endline Survey, 2023

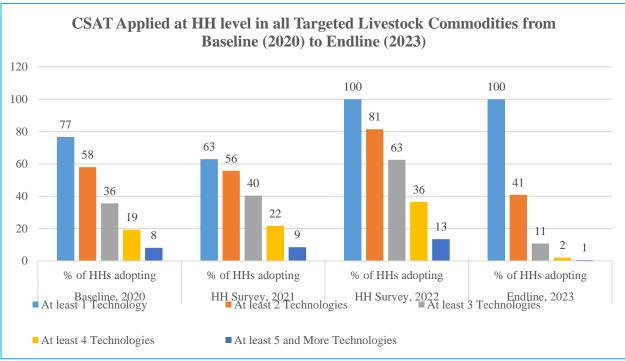

Figure 6: CSAT Applied at HH level in all Targeted Livestock Commodities from Baseline (2020) to Endline (2023)

From the above table and graph, it can be seen that 77 and 63 per cent of farmers used to adopt at least one CSAT in their livestock farms in 2020 (baseline) and in 2021 respectively, which increased to 100% in 2022, and endline (2023). Women's involvement in the CSATs in the livestock farms, were 96% in 2023, which was 56% in the baseline (2020). This shows that women were encouraged to adopt climate smart technologies in their livestock farms, as supported by the project-NLSIP.

# 3.1.4. Farmers' Access to Agriculture Assets and Services

The results regarding farmers' access to agriculture assets and services for all three targeted value chain commodities from baseline (2020) to endline (2023), are discussed as follows.

Among the assets received by the farmers in 2023, maximum (41 %) of farmers had access to sheds provided by the project, which was 8.6% in 2020, and 14.7% in 2021. The next important livestock asset was the chaffcutters, i.e. 33 % received in 2023, which was 15.6% in 2020, and none in 2021 and 2022. Of the access to assets, the proportion of women receiving assets were 17.4 % in 2020, 22.1% in 2021, and 66% in 2023. No data were found for the year 2022.

Similarly, among the services received by the farmers, 33.4 % of them received Artificial Insemination (AI) services from the project in 2023, which was nil in 2020, and 1.9% in 2021. The second important service was the vaccination services against FMD and PPR, i.e. 26.5% in 2023, and 5% in 2021. The proportion of women receiving serices are very less.

The figures on the farmers' access to agricultural assets and services in endline (2023) compared with the baseline (2020) are presented in the following table.

| Table 13: I                 | Farmers' Ac              | ccess to A                     | Table 13: Farmers' Access to Agriculture Assets and Services in All value chains from Baseline (2020) to Endline (2023) |                          |                                |                      |                          |                                |                      |                          |                                |                      |

# **3.2. Overall Impact of the Project (Task 1)**

The overall impact of the Project-NLSIP, based on the data collected during the Endline Survey (2023), are discussed as under:

### 3.2.1. Productivity of Targeted Livestock Commodities

As per the project design report of the NLSIP, there are basically three targeted livestock value chain commodities-milk, goat meat and Chyangra Pashmina. Productivity of targeted livestock commodities is one of the important PDO level indicators of the Project-NLSIP. The productivity of milk (cow and buffalo), goat meat, and Chyangra Pashmina as found in the Endlline survey, 2023, compared with the baseline (2020), and are discussed in the following sub-sections.

The milk productivity per year per standing cattle was found out to be 2239 litre in 2023, increased by 83% as compared to baseline 2020 (1222 litre). Similarly, milk productivity per year per standing buffalo was found out to be 1346 litre in 2023, increased by 87% as compared to baseline 2020 (720 litre). The productivity of goat, measured in carcass weight, was increased by 73% in 2023 (13.5 kg per goat per year) as compared to baseline productivity of 7.8 kg per goat per year.

The productivities of targeted livestock commodities compared with the baseline (2020) and endline (2023), have been presented in the following table.

| S.N. | PDO Indicators               | Units   | <b>Baseline, 2020</b><br>(N=dairy: 673,<br>goat meat: 627) | Endline, 2023<br>(N=dairy: 486<br>and goat: 679) | Increased % |
|------|------------------------------|---|--|--|-------------|
| 1    | Cow Milk<br>Productivity     | Litres/Year/Standing<br>Cow                   | 1222   | 2239.5   | 83.3        |
| 2    | Buffalo Milk<br>Productivity | Litres/Year/Standing<br>Buffalo               | 720  | 1346.4   | 87          |

 (2020) to Endline (2023)

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

### **Reasons for Increment of Productivity**

Such increment (83%) of the milk productivity of cow in 2023 as compared to the baseline was due to following reasons, as supported by the following table. The below table depicts that the cattle rearing households used to increase number of improved cow and reduce the local cow, and increased number of lactating cow in their herd, and thereby reducing overall herd size, i.e. from 6.09 to 4.09 from baseline to endline respectively. In addition, the lactation length of cow in 2023 was increased by 13% as compared to the baseline (2020). Such positive results were seen at the household level in Task-1, because of project's supports such as vaccination against FMD, parasite control, AI services, and

<sup>&</sup>lt;sup>4</sup> The productivity of the goat meat has been re-estimated to be 7.79 kg of carcass weight during the baseline year (2020)

application of climate smart technologies such as improved shed management, promotion of forage and fodder cultivation etc through the componenet B of the Project.

 Baseline (2020) and Endline (2023)

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

In the case of buffalo milk productivity, such increment (87%) of the milk productivity of buffalo, as compared to the baseline, was due to the following reasons, as supported by the following table. As in the cow, the table below depicts that the buffalo rearing households used to increase number of improved buffalo and reduce the local buffalo, and increased number of lactating buffalo in their herd, and therby reducing the overall herd size, i.e. from 4.8 to 4.58 from baseline to endline respectively. In addition, the lactation length of buffalo in 2023 was increased by around 4% as compared to the baseline (2020). These positive results were seen at the household level in Task-1, because of the project's supports as mentioned above for cattle.

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

In case of goat, the farmers used to decrease the herd size with increased number of cross-bred and exotic breed in their herds. At the same time per household goat meat production was also increased in 2023 as compared to the baseline (2020). Figures regarding per household herd size and production of goat has been presented in the following table. Such increment in goat meat productivity, as mentioned above, at the household level in Task-1, was because of several support programs implemented at the household levels through the component B of the Project, such as, promotion of stall-feeding,

vaccination against PPR, parasite control programs, and use of climate smart technologies such as improved shed management, expanding forage and fodder cultivation, manure management and stall feeding.

| S.N. | INDICATORS           | UNITS       | BASELINE,   | ENDLINE,    | <b>INCREASED %</b> |

 Table 17: Comparison of Herd Size and Meat Produciton of Goat between Baseline (2020) and Endline (2023)

# 3.2.2. Sales of Value Added Livestock Commodities

Sales value of the three major livestock commodities (milk, goat meat and Chyangra Pashmina) and their value-added products are also the major impact indicators, as per the NLSIP design report. Based on the endline survey results, these indicators are presented and discussed in the following sections.

Sales value of milk and milk products per household per year which was NRs. 396 thousand in 2020 (baseline) was increased to NRs. 599 thousand in 2023, with increment of 51%. Most of the sales income of dairy households were from raw milk sale 99% and 98.5% in 2020 and 2023 respectively, showing very less amout of value addition of milk in baseline and endline as well. It was also observed that about 93.5% of the milk production was sold in 2023. The average selling price of raw milk during baseline (2020) was recorded to be Rs. 62.1 per liter, increased to Rs. 67.5 per liter in 2023.

The sales value of goat meat per household, which was NRs. 55,670 in 2020 (baseline), increased to NRs. 107.35 thousand, with increment of 93 %. It was also observed that about 42% of total goat meat production was recorded to have been sold in 2023. As such 176.49 kg live weight of goat per household was recorded to have been sold in 2023 with average price of Rs. 608.27 per kg of live weight. However, there was no value addition in goat observed in 2023, which in 2020 there was 6% of value addition in the form of raw meat and buck sale.

The sales values of the three major livestock commodities compared with the baseline (2020) and endline (2023) have been presented in the following table.

 Table 18: Comparison of Sales Value of Value-added Products of Targeted Livestock Commodities

 from Baseline (2020) to Endline (2023) (at current price)

| S.N. | PDO Indicators                                 | Units                  | <b>Baseline,</b><br>2020<br>(N=dairy:<br>673, goat<br>meat:<br>627) | <b>Endline,</b><br><b>2023</b><br>(N=dairy<br>: 486 and<br>goat:<br>679) | Sales value<br>increased<br>(%) |
|------|--|------------------------|---|--|---------------------------------|
| 1    | Sales Value of Milk and Milk<br>Products       | NRs (,000) / HH / Year | 396   | 598.96   | 51.25                           |
| 1.1  | Sale of Raw Milk                               | NRs (,000) / HH / Year | 392   | 590.56   | 50.65                           |
| 1.2  | Sale of Value-Added Products                   | NRs (,000) / HH / Year | 4   | 8.40   | 110.00                          |

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

# **Reasons for Increased Sales Value**

Sales value of milk was found to be increased at the household level in 2023, due to increase in per household milk production and milk sold. The volume of milk sold per household which was 6312 liter in 2020, increased to 8749 liter in 2023. The average milk production per household in 2023 was estimated to be 9351.77 liter per year, of which 93.55% of household milk production used to be sold in 2023.

Similarly, as goat meat (on live weight basis) sold per household in 2020 was 92 kg, increased to 176 kg in 2023. As such, the value of goat meat sold per household increased by 93% in 2023 as compared to the baseline. The sales value of live goat in 2023 was also increased due to increased sale price of live weight, i.e. Rs. 569 per kg in 2020 increased to Rs. 608 in 2023.

### Estimation of Sales Value after Adjusting the Inflation

An attempt has also been made to compare the sales value after adjusting the inflation, which has been presented in the following table.

| -    | Commodifies from Daschine (2                   | /                         |  | v  | · F · · · /                     |
|------|--|---------------------------|--|--|---------------------------------|
| S.N. | PDO Indicators                                 | Units                     | <b>Baseline,</b><br>2020<br>(N=dairy:<br>673, goat<br>meat: 627) | <b>Endline,</b><br><b>2023</b><br>(N=dairy:<br>486 and<br>goat: 679) | Sales value<br>increased<br>(%) |
| 1    | Sales Value of Milk and Milk<br>Products       | NRs (,000) /<br>HH / Year | 396  | <b>520.15</b> <sup>5</sup>   | 31.35                           |
| 1.1  | Sale of Raw Milk                               | NRs (,000) / HH<br>/ Year | 392  | 512.856  | 30.83                           |
| 1.2  | Sale of Value-Added Products                   | NRs (,000) / HH<br>/ Year | 4  | 7.30   | 82.25                           |
| 2    | Sales Value of Goat & Value-<br>Added Products | NRs (,000) /<br>HH / Year | 55.67  | 93.23 <sup>7</sup>   | 67.46                           |

| 2.2  | Sales of Value-Added Products                  | NRs (,000) / HH<br>/ Year | 3.35   | -  | _                               |

| Table 19: Comparison of Sales Volume and Value of Value-added products of Targeted Livestock |
|--|
| Commodities from Baseline (2020) to Endline (2023) (at constant / base year price)           |

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

From above table, it can be seen, after adjusting the inflation, that there was 31.35% of increment of real value of milk sale, and 67.4% of increment of real value of goat sale from baseline (2020) to endline (2023). Such increments of sale of milk and goat meat were due to 62% increment of per household milk production and 181% increment of per household goat meat production, from baseline (2020) to endline (2023).

# 3.2.3. Farmers Adopting Climate Smart Agricultural (CSA) Technology

The results regarding adoption of Climate Smart Agricultural Technologies (CSATs) by farmers for all three value chains under Component B (Task-1) are presented and discussed in the successive sections below.

The project-NLSIP has been promoting seven types of climate smart agricultural technologies (CSATs), which farmers are using in three targeted livestock commodities. They include: (i) Improved management of the shed, (ii) Management of manure, (iii) Fodders, forage production and pasture development, (iv) Production of hay and silage, (v) Feeding of stall, (vi) Forage seed production, and (vii) Saplings/seedlings production. The CSAT used by producer farmers in all three targeted livestock commodities is highlighted in the next subsections.

Out of the seven-climate smart tehnologies, maximum (59%) farmers used to adopt improved shed management technologies, followed by manure management (46%), and fodders, forage production and pasture development (26%), and least in saplings/seedlings production (0.3%) in 2023. This has been presented in the following table. These figures on the use of CSATs have positive impact on the productivity increase in the dairy and goat value chain, as mentioned above in Section 3.1.1.

| Climate Smart Agricultural Technologies               | Cooperative<br>(N=295) |       | Farmer<br>(N=8 | *     | Total (N=1182) |       |
|---|------------------------|-------|----------------|-------|----------------|-------|

 Table 20: Climate Smart Agricultural Technologies applied at HH level in Targeted Livestock

 Commodities in in all Value Chains in 2023

Source: Endline Survey of NLSIP, 2023

The above results as obtatained from the endline survey could not be compared with the baseline, as there were no numbers in each type of CSATs in the baseline.

However, an attempt has also been made to compare on the number of technologies adoption of Climate Smart Agricultural Technonogies (CSATs) in the targeted livestock commodities by the farmers between baseline (2020) and endline (2023), and the results have been presented in the following table.

|  | Baseline, 2020 (N=1400 HHs) |                                       |                                     |                              | Endline, 2023 (N=1182 HHs) |                                       |                                     |                        |

| Total                                      | 1400                        | 1074                                  | 100                                 | 43.29                        | 1182                       | 1182                                  |                                     | 96.19                  |

| Table 21: Comparison of CSAT Applied at HH level in all Targeted Livestock Commodities between |  |  |  |  |  |
|--|--|--|--|--|--|
| Baseline (2020) and Endline (2023)   |  |  |  |  |  |

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

From the above table, it can be seen that 100% of the producer farmers in endline (2023) used to adopt at least one CSAT in their farms, as promoted by the project-NLSIP, as against 77 % farmers who used to adopt at least one CSAT in the baseline year (2020). Out of the total number of households using at least one technology, the involvement of women was 56.4% in the baseline (2020), increased to 96% in 2023. In total, where there was 43.29% of involvement of women in baseline (2020), increased to 96% in endline (2023). This shows that women were encouraged to adopt climate smart technologies in their livestock farms, as supported by the project-NLSIP.

### Benefits of CSAT Adoption at the Household Level

Out of 1182 households surveyed under Task-1, 86% of them reported that CSAT applied in their farms increased production, 65% reported that it reduced the health problem of the livestock, 45% reported that it increased in feed availability, and 40% of them reported improved reproduction of livestock. Figures regarding the benefit of CSAT at farm levels as reported by the producer farmers under component B (Task-1) have been presented in the following table.

|                                | Cooperative (N=295) |           | Farmer Gro | up (N=887) | Total (N=1182) |           |
|--------------------------------|---------------------|-----------|------------|------------|----------------|-----------|
| Benefits of CST                | No. of HH           | % of HH   | No. of HH  | % of HH    | No. of HH      | % of HH   |
|                                | reporting           | reporting | reporting  | reporting  | reporting      | reporting |

 Table 22: Benefit of CSAT adoption at the Household level (2023)

Source: Endline Survey of NLSIP, 2023

Value chain wise adoption of Climate Smart Agricultural Technologies in 2023, compared with the baseline (2020) have been presented in the following sub-sections.

### (a) Climate Smart Technologies in Dairy Value Chain and their Adoption Rate in 2023

Among the 7-climate smart agricultural technologies (CSATs), 60 % of dairy farms, out of total 487, were found practicing manure management, followed by improved shed management (55%), and least in saplings/seedlings production (0.21%) in 2023. This has been presented in the following table.

| Types of Climate Smart Agricultural Technologies<br>(CSAT) | Number of HH<br>adopting CSAT<br>(N=487) | % of HH<br>responding |
|--|--|-----------------------|
| Improved shed management                                   | 267                                      | 54.83                 |
| Manure management  | 291                                      | 59.75                 |
| Fodders, Forage Production and Pasture Development         | 113                                      | 23.20                 |
| Hay and Silage making                                      | 12                                       | 2.46                  |
| Stall feeding  | 74                                       | 15.20                 |
| Forage seed production                                     | 4  | 0.82                  |
| Saplings/seedlings production                              | 1  | 0.21                  |

Table 23: Climate Smart Technologies in Dairy Value Chain and their Adoption Rate in 2023

Source: Endline Survey of NLSIP, 2023

From the below table for Dairy Value Chain, it can be seen that 100% of the milk producer farmers in endline (2023) used to adopt at least one CSAT in their dairy farms, as promoted by the project-NLSIP, as against 87.5 % dairy farmers who used to adopt at least one CSAT in the baseline year (2020). Out of the total number of dairy households using at least one technology, the involvement of women using CSATs, which was 50% in the baseline (2020), increased to 97% in 2023. In total, where there was 44% of involvement of women in dairy farms in baseline (2020), increased to 97% in endline (2023). This shows that women were encouraged to adopt climate smart technologies in the dairy farms, as supported by the project-NLSIP.

### (b) Climate Smart Technologies in Goat Value Chain and their Adoption Rate in 2023

Among the 7-climate smart agricultural technologies (CSATs) promoted by the NLSIP, nearly 62 % of goat farms, out of 678, were found practicing improved shed management, followed by manure management (36%), fodders, forage production and pasture development (28%), and least in saplings/seedling production (0.29%) in 2023. This has been presented in following table.

| Table 25: Climate Smart Technologies in Goat Value Chain and their Adoption Rate in 2023 |  |                       |  |  |  |  |

Source: Endline Survey of NLSIP, 2023

From the below table for Goat Value Chain, it can be seen that 100% of the goat producer farmers in endline (2023) used to adopt at least one CSAT in their goat farms, as promoted by the project-NLSIP, as against 76 % goat farmers who used to adopt at least one CSAT in the baseline year (2020). Out of the total number of goat rearing households using at least one technology, the involvement of women was 64% in the baseline (2020), increased to 96% in 2023. In total, where there was 49% of involvement of women in use of CSATs in goat farms in baseline (2020), increased to 96% in endline (2023). This shows that, as also in the dairy farms, women were encouraged to adopt climate smart agricultural technologies in their goat farms, as supported by the project-NLSIP.

# (c) Climate-Smart Technologies in Chyangra Pashmina Value Chain and their Adoption Rate in 2023

Among the 7 climate-smart agricultural technologies (CSATs), nearly 59 % of Chyangra farms, out of 17, were found practicing manure management, followed by improved shed management (47%), hay and silage making (29.4%) in 2023. There were no stall feeding, forage seed production, and saplings/seedlings production technologies practiced in Chyangra Pashmina value chains. This has been presented in following table.

| Table 27: Climate-Smart Technologies in <a href="https://www.chainandtwo.com">Chyangra Pashmina</a> Value Chain and their Adoption Rate |
|---|
| in 2023   |

# 3.2.4. Share of Project Beneficiaries with a Livestock Risk Insurance Policy

There is significant increment (47%) can be seen in the share of project beneficiaries in insurance in the dairy value chain in the year 2023 (74.3%), as compared to the baseline value (50.5%). At the same time, highly significant increment (77.64%) in the share of project beneficiaries in insurance in the goat value chain has been observed in the endline (28.6%) as compared to the baseline value (16.1%). But the insurance coverage in 2023, in real sense has been seen much lesser than that of expected both in dairy and goat value chain, i.e. 74% and 29% respectively, and no insurance coverage was observed in the Chyangra Pashmina value chain. Such lesser insurance coverage in dairy and goat value chains was due to non application of mandatory insurance provision made by the project for Component B (Task 1) households.

As a result, in overall, the share of project beneficiaris with livestock insurance policy applied in the dairy, goat and Chyngra farms has been observed as 47% as compared to the target of 60% in the year 2023, with achievement of 78.4% of the target. The percent share of women beneficiaries with livestock insurance policy in 2023 was recorded to be 24.5%, which is 54.5% achievement against the target of 45%. This figure, however, could not be compared with the baseline, as there were no data on the achievement. Such lesser achievement in all value chains as a whole (47%) was observed due to none insurance (zero) in the Chyangra farms and lesser (29%) insurance in goat value chain, and also due to non-application of mandatory insurance provision for the Component B supported livestock farms, also as mentioned above.

The figures on the share of project beneficiaries with livestock risk insurance policy, compared between baseline and endline, have been presented in the following table.

\*Detail on *Livestock Insurance*, 2023 given in Annex-1.

### **3.2.4.1.** Reasons for lesser livestock insurance

According to the farmers, the low percentage of livestock insurance observed in 2023 was caused by under-valuation of exotic and pure breeds, delayed settlement of claims for compensation, absence of

insurance for young livestocks, and very compex administrative processs involved in receiving compensations.

The farmers' answers regarding how easy the compensation procedure was are shown in the following table. Of the farmers who got compensation for their dairy cows, the majority (77%) said the process was not easy, 21% said it was easy, and 2.2% said it was very easy. Similarly, of the farmers in the goat operation who received remuneration, 58% said it was not easy to be paid, 38% said it was easy, and 3.6% said it was really easy. This has been presented in the following table.

Table 30: Responses of Farmers on receiving Compensations for Claim of Livestock Insurance in2023

| Deen en ses of Formers      | % of HHs         | s reporting     |

# 3.2.4.2. Compensation received by Households for Dead and Disabled livestocks in Task 1 in 2023

From the below table we can see that only 64% of households under Task 1, could receive compensation against their claims for the dead livestocks and disabled productive livestocks, for which they had insured. Among the value chains, only 67% of cow, 50% of buffalo, and 64% of goat rearing households of Task 1 were able to receive compensation of their dead livestocks. The figures on the number of households applied and received compensation against their claims for livestock insurance as observed in 2023 under Task 1, have been presented in the following table.

|         | Compensation                       |                       |                        |                      |  |  |  |  |
|---------|------------------------------------|-----------------------|------------------------|----------------------|--|--|--|--|

# 3.2.5. Farmers' Access to Agriculture Assets and Services

The results regarding farmers' access to agriculture assets and services for all three targeted value chain commodities during baseline and endline period are discussed in the following sub-sections.

# (a) Farmers' Access to Agriculture Assets and Services in Dairy Value Chain

Among the assets received by dairy farmers in 2023, maximum (56 %) of dairy farmers had access to milk cans provided by the project. The next important livestock asset is the shed, i.e. 33.5 % farms had access to sheds in their dairy farms in 2023, provided by the project. About 32 % of dairy farms had access to chaff-cutters and 20.4% in livelivestockin 2023, which were provided by the project.

Among the services received by dairy farmers, 77 % of them received Artificial Insemination (AI) services from the project in 2023, which was nil in 2020. Similarly, 34% of dairy farmers received vaccination services from the project, which was nil in 2020. In overall, 65 % of women had access to productive assets and services in 2023 in dairy value chain, which could not be compared with the baseline.

The figures on the farmers' access to agricultural assets and services in endline (2023) compared with the baseline (2020) are presented in the following table.

|                              |                         | U                           | =673 HHs)            |                         | ne (2023) (N=48             |                      |

Table 32: Farmers' Access to Agriculture Assets and Services in Dairy value chain

### (b) Farmers' Access to Agriculture Assets and Services in Goat Value Chain

Among the assets received by goat rearing farmers, maximum (45.4%) farm household had access to sheds in 2023, which were provided by the project, which was 18% in 2020. About 16.5% of goat rearing farmers received live livestock (goats) and 32% of them received chaff-cutters from the project in 2023.

Among the services received by goat-rearing farmers from the project, about 20 % of farmers received vaccinations, 21% received medicines for parasite control, and 10 to 12 % of farmers received forage seeds (winter and summer) from the project. In overall, 45 % of women had access to productive assets and services in 2023, which could not be compared with the baseline.

The figures regarding access to agricultural assets and services in goat value chain are presented in the following table.

# (c) Farmers' Access to Agriculture Assets and Services in Chyangra Pashmina Value Chain

About 65% of Chyangra rearing farmers had access to sheds, 53% owned solar panels, 35% owned weighing balance, and 94% of them owned chaff-cutters in 2023, as provided by the project. At the same time, more than 76% of Chyangra rearing farms had access to vaccination and medicines provided

by the project in 2023. There was 88 % of women who had access to productive assets and services in Chyangra Pashmina value chain in 2023, which could not be compared with the baseline. The figures on the access to agricultural assets and services in Chyangra farms during baseline and endline are presented in the following table.

#### Table 34: Farmers' Access to Agriculture Assets and Services in Chyangra Pashmina value chain

# 3.2.6. Beneficiary Satisfaction on Project's and PO's Services under Task-1

The project-NLSIP has provided various types of services to producer farmers under component B (Task 1) through the farmers' groups and cooperatives, termed as Producers' Organizations (POs). The POs were also providing various kinds of services to their member farmers. In this section, the responses of the beneficiary households on their satisfaction level towards the project's services and PO's services they had received during the project implementation phase, have been presented and discussed in the following sub-sections.

# 3.2.6.1. Beneficiaries' Satisfaction Levels on Project's Services with Relevance, Timeliness and Effectiveness

The reflection of the majority (nearly half of them or 43 %) of beneficiaries on the project's supports was on the "moderately satisfied". Among all 1182 surveyed households, 6 per cent of beneficiaries reported that they were "highly satisfied", and around 15 per cent of the beneficiaries were "satisfied" from the Project's services. If we sum the positive satisfaction only, this comes to around two third, indicating about 64 % of the beneficiaries were "satisfied" from the services provided by the project. There were 66.5 % of women satisfied on the project's supports in total, of which 9% were highly satisfied, 18% satisfied, and 40% moderately satisfied. However, around 19% of them were "unsatisfied" in total. This may be due to not enough supports provided by the project and many of them could not receive the grant supports (sub-projects) from the project's services, and also their average values, have been presented in the following table and figure.

|               |                  |  | Project       | t' Support               |                               |                 |       |  |
|---------------|------------------|--|---------------|--------------------------|-------------------------------|-----------------|-------|--|

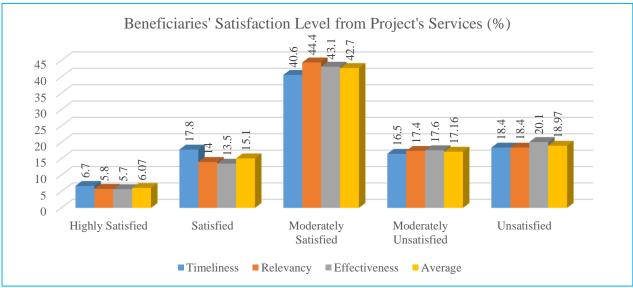

Figure 7: Beneficiaries' Satisfaction on Project's Services (Task-1)

### 3.2.6.2. Beneficiaries' Satisfaction Levels on PO's Services under Task-1 (HH level)

The farmers' groups and cooperatives used to provide services like training on technical aspects, business aspects, account and book-keeping, and nursery management to their members. It was found from the household survey under Task-1, that dairy farmers were satisfied more from technical training, account training and nursery management. Whereas, goat rearing farmers were satisfied most from all types of services as the account training, technical training, nursery management and business training. In case of marketing services rendered by the POs to their member farmers, dissemination of market price information was the major service, for which 79 % of dairy farmers and 63% of goat rearing farmers were satisfied from the POs' services. The per cent of households reported on their satisfaction level for different types of services provided by their POs have been presented in the following table.

| Services provided by                 | Satisfaction Level        | % of HHs reporting |                   |  |
|--------------------------------------|---------------------------|--------------------|-------------------|--|
| POs                                  | reported by Beneficiaries | Dairy (N=487)      | Goat Meat (N=678) |  |
|                                      | High                      | 45.8               | 74.2              |  |

Source: Baseline, 2020, and Endline Survey of NLSIP, 2023

The cost of production per liter of milk at household level was estimated to be Rs. 45.30, which was Rs. 44.60 in baseline (2020), increased by Rs. 0.70 per liter. Profit per liter of milk was Rs. 17.5 in 2020, increased to 22.20 in 2023.

Similarly, the cost of production of goat meat on live weight in 2020 was Rs. 178.10, increased to Rs. 249.94 in 2023, increased by Rs. 71.84 per kg. Profit per kg of goat (on live weight) in 2020 was Rs. 391, which decreased to Rs. 358 in 2023.

\*Detail on Cost of Production and Profitability Analysis of Dairy and Goat enterprises in Task-1 in 2023 is given in Annex-2.

### 3.2.8. Employment Generation in 2023 at HH Level

The employment generated by the targeted livestock (dairy and goat) value chains at the farm levels as supported by the Project-NLSIP, has been presented and discussed in the below sub-sections. As there were no results on the employment generated at the household levels during the baseline survey, the results on the employment generated during endline (2023) could not be compared with the baseline.

#### 3.2.8.1. Employment Generation at HH level in all three Value Chains in 2023

It was found that, on an average, a livestock enterprise could generate 2.6 persons of full employment, as recorded in 2023, for all value chains in total, of which 2.4 persons for family/self-employed, and very less in hired labours. Women were found to be engaged more in the livestock rearing, i.e. 57.5% of the total labour hours than the men (42.5%). The results on the employment generation in all value chains (dairy, goat meat, and chyngra pashmina), as obtained from the household survey conducted in 2023, have been presented in the following table.

|                  |                           | progiment Generation at 1111 10; et in 111 en el contains in 2020 |         |             |                       |  |  |  |  |
|------------------|---------------------------|---|---------|-------------|-----------------------|--|--|--|--|

 Table 39: Employment Generation at HH level in All three Value Chains in 2023

Source: Endline Survey of NLSIP, 2023

As per the minimum wage rate of Rs. 17,300 per month, as fixed by the GoN, a household is providing Rs. 541,836 of employment from the livestock enterprises, of which Rs. 45,672 for hired labour and rest Rs. 496,164 as family labour.

### 3.2.8.2. Employment Generation at HH level in Dairy Value Chain in 2023

It was found that the dairy enterprise run by the farmers in the NLSIP Project área could generate 2.4 persons of full employment per household/Enterprise for full year, which is almost of family self-employed, as recorded in the year 2023. Of the total labour hours, women were found to have been more engaged in the dairy enterprises, i.e. 56% of time given by the women. No any seasonal (part-time) labours were found to have worked in the dairy businesses in the Project área. The figures on the employment generation in dairy business in the NLSIP Project área, as recorded in the year-2023, have been presented in the following table.

 Table 40: Employment Generation at HH level in Dairy Value Chain in 2023

Source: Endline Survey of NLSIP, 2023

A dairy household is providing Rs. 496,164 of employment from the dairy enterprises and mostly retained with the family labour (Rs. 494,088).

#### 3.2.8.3. Employment Generation at HH level in Goat Value Chain in 2023

In case of goat value chain, 2.65 persons of labour employment was found to have been generated per goat farm for the whole year, of which 2.39 persons (90% of total employment) is from family labour or self-employed in the goat enterprise in the NLSIP Project área. As also in the dairy enterprise, women were found to have been engaged more (55%) than the men (45%) in the goat enterprise. The figures on the employment generation by the goat enterprise in the NLSIP Project área, obtained from the survey-2023, have been presented in the following table.

| 1 au       | 41: Employment Generation at HH level in Goat value Chain in 2025 |                          |        |         |                |                             |  |  |

Table 41: Employment Generation at HH level in Goat Value Chain in 2023

Source: Endline Survey of NLSIP, 2023

A goat rearing household is providing Rs. 550,140 of employment from the goat enterprises, of which Rs. 496,164 as family labour.

#### 3.2.8.4. Employment Generation at HH level in Chyangra Pashmina Value Chain in 2023

Among the three targeted livestock commodities, Dairy, Goat meat and Chyangra Pashmina, the Chyangra Pashmina value chain was found generating more labour employment (3.06 persons) for whole year, of which 2.65 persons of family labour or self-employed and 0.41 persons of hired labour. Unlike in other two enterprises, engagement of female labour was found much lesser, i.e. 38.5% of the total work load in the Chyangra Pashmina enterprise. As Chyangra are reared in high mountain áreas and mostly reared on the rangeland for grazing, mostly men are engaged for Chyangra rearing, because of this, women are employed less in the Chyangra rearing. The figures on the employment generation by the Chyangra Pashmina enterprises in the NLSIP Project área, obtained from the survey- 2023, have been presented in the following table. A Chyangra rearing household is providing Rs. 635,256 of employment from the Chyangra enterprises, of which Rs. 550,140 as family labour wage.

### 3.2.9. Value Chain Linkages and Productive Alliances between Beneficiary HHs / Commercial Producers and Buyers/Traders in 2023

It was found that 77% out of 1182 surveyed households (farmers) used to sell their livestock products to the buyers/sellers, with 73% among cooperatives, and 79% among group led farmers. Out of the total sellers (farmers), 11% had formal agreement with the buyers/traders, with 24% in cooperatives, and 7% in group led farmers. Out of total sellers/farmers selling livestock products, 8.3% of them used to sell to NLSIP supported buyers/traders, 41.5% selling to other organization supported buyers/traders, and rest 50% used to sell to other buyers. While comparing between the cooperatives and group led farmers, 15% and 6.3% of the respective farmers used to sell to NLSIP supported buyers/traders, respectively. Nearly 19% of the sellers/farmers, reported that there is compliance of agreement (both formal and informal), 31% reported non-compliance of the agreement they had made, and rest 50% of them did not respond to the questions. The agreement made between cooperative-led farmers and buyers/traders was found more effective (48% reporting complied) than that with the group-led famers (9.4% reporting complied). This has been presented in the following table.

| Productive alliance between<br>Beneficiary HH and<br>Buyer/Processer/Trader |                                      | Cooperative (N=295)    |                      | Farmer<br>(N=8         | Group                | Total (N=1182)            |                      |

| of  | No                                   | 284                       | 62.69                | 1                         | 0.22                     | 0                           | 0.00                 |
| Agreement   | No response                          | 0                         | 0.00                 | 458                       | 99.57                    | 0                           | 0.00                 |

It can be seen from the above table that 93% of the dairy farmers used to sell their products (mostly raw milk) to the various types of buyers. Out of the total sellers (milk producers), 22% of them were found to have established formal linkage (formal agreement) with the buyers, and rest 78% of them used to sell with informal agreement. Out of the total milk sellers, 16.5% used to sell to the NLSIP supported traders. The beneficiary households had made formal agreement with buyers at household level. 37% of the milk sellers reported that there is compliance of the agreement, irrespective of formal or informal agreement.

In case of goat value chain, 68% of total 678 household surveyed, reported that they sold goat during last year (FY 2022/23), and mostly on the informal basis, that only two of them found to have made formal agreement with the buyers. Whereas, in Chyangra Pashmina value chain, only one producer could sell his/her livestock products during last fiscal year, on informal basis.

### 3.2.10. Household Income from Targeted Livestock Commodities (Task-1)

Among the 487 households who were doing dairy business under Task-1, total household income per year was estimated to be Rs. 746,615.00, of which income from sale of milk and milk products was found out to be Rs. 598,960.00 per household per year, accounting for 80.22% of the total household income in 2023, and which increased by 51.25% as compared to baseline average income of Rs. 396,000.00 from sale of milk and milk products in 2020.

Similarly, goat rearing farmers' average household income was estimated to be Rs. 356,203.00, of which 30% of total household income came from sale of goat, i.e. Rs. 107,351.00 per year, which increased by 93% from the sales value of goat recorded in baseline (Rs.55,667.00).

The figures regarding the average income earned by the households, under Task-1 in the NLSIP project areas, have been presented in the following table.

| Sources                                    | Baseline (2020)<br>(N=Dairy: 673;<br>Goat: 627) | Endline (2023)<br>(N=Dairy: 486;<br>Goat: 679) | Increased % |
|--|---|--|-------------|
| Dairy                                      | 396,000   | 746,615  | 88.06       |
| Income from sale of milk and milk products | 396,000   | 598,960  | 51.25       |
| Income from other sources                  | -   | 147,655  | -           |
| Goat Meat                                  | 55,667  | 356,203  | 539.88      |
| Income from sale of Goat                   | 55,667  | 107,351  | 92.84       |
| Income from other sources                  | -   | 248,852  | -           |

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

#### 3.2.11. Food Security at household level by Value Chains (Daiy, Goat and Chyangra Pashmina)

Out of the 1182 households interviewed under Task-1 for all three value chains, about 91% of the households reported to have food sufficiency at the household level in 2023, which in the baseline (2020) was 0.14%. Only 2.4 % of them reported to have food sufficiency with less than 3 months in 2023, which in 2020 it was nearly 25% of the households who had food sufficiency of less tan 3 months. The results regarding the food sufficiency status at the household level as supported by the Component B of the Project has clearly indicated that the Project has significant contribution in increasing the food sufficiency level among the beneficiary households. The figures on the food sufficiency at the household level, compared between baseline (2020) and endline (2023) have been presented in the following table.

| Months              | Baseline (2020) | 1      | Endline (2023) |        |
|---------------------|-----------------|--------|----------------|--------|
|                     | No. HHs         | %      | No. HHs        | %      |
| Less than 3 Month   | 346             | 24.71  | 28             | 2.40   |
| 3-6 Months          | 162             | 11.57  | 54             | 4.60   |
| 6-9 Months          | 78              | 5.57   | 20             | 1.70   |
| 9-12 Months         | 812             | 58.00  | 5              | 0.40   |
| More than 12 months | 2               | 0.14   | 1075           | 90.90  |
| Total               | 1400            | 100.00 | 1182           | 100.00 |

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

In case of dairy value chain, about 85% of the 487 households interviewed reported to have food sufficiency at household level in 2023, which was only 0.3% in the baseline (2020). This significant increment on the food sufficiency status at the dairy household shows that the Project had significant impact on the food sufficiency among the dairy farmers due to significant increase in the milk production, productivity and their sales. The 21% of dairy farmers who had food sufficiency of less than 3 months in 2020, decreased to 3% in 2023, also shows the positive impact of the project's intervention. The details regarding the food sufficiency status among the dairy farmers compared between the baseline (2020) and the endline (2023) have been presented in the following table.

| Months              | Baseline (20) | 20)   | Endline (2 | 023)   |
|---------------------|---------------|-------|------------|--------|
|                     | No. HHs       | %     | No. HHs    | %      |
| Less than 3 Month   | 139           | 20.7  | 15         | 3.10   |
| 3-6 Months          | 41            | 6.1   | 40         | 8.20   |
| 6-9 Months          | 42            | 6.2   | 17         | 0.50   |
| 9-12 Months         | 449           | 66.7  | 3          | 0.60   |
| More than 12 months | 2             | 0.3   | 412        | 84.60  |
| Total               | 673           | 100.0 | 487        | 100.00 |

#### Table 47. Food Sufficiency Status in Daimy Value Chain

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

Similarly in the Goat value chain, about 96% of the 678 households interviewed reported to have food sufficiency at household level in 2023, where there were no such farm families having food sufficiency in the year 2020 (baseline). This significant increment on the food sufficiency status at the goat rearing households, as also in the dairy households, shows that the Project had significant impact on the food sufficiency among the goat rearing farmers due to significant increase in the goat meat production, productivity and their sales, both in quantity and value. The 25% of goat rearing farmers who had food sufficiency of less than 3 months in 2020, decreased to around 2% in 2023, also shows the positive impact of the project's intervention in the goat value chain. The details regarding the food sufficiency status of goat rearing farmers compared between the baseline (2020) and the endline (2023) have been presented in the following table.

| Table 48: Food Sufficiency Status in Goat Value Chain |                 |       |                |        |  |  |  |  |  |

| Total   | 627             | 100.0 | 678            | 100.00 |  |  |  |  |  |

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

In case of Chyangra Pashmina value chain, 82% of the 17 Chyangra rearing farmers, who were interviewed under Task-1, reported to have food sufficiency in the year 2023, for which there were no farmers having food sufficiency in 2020 (baseline). Also, 53% of Chyangra rearing farmers in 2020, who had less than 3 months of food sufficiency, decreased to around 6% in 2023. This also shows that the Project had good impact also in the Chyangra Pashmina value chain. The figures regarding the food sufficiency status in the Chyangra Pashmina value chain compared between the baseline and endline have been presented in the following table.

| Months              | Baseline (2020) |      | Endline (2023) |        |  |
|---------------------|-----------------|------|----------------|--------|--|
|                     | No. HHs         | %    | No. HHs        | %      |  |
| Less than 3 Month   | 53              | 53.0 | 1              | 5.90   |  |
| 3-6 Months          | 38              | 38.0 | 0              | 0.00   |  |
| 6-9 Months          | 3               | 3.0  | 0              | 0.00   |  |
| 9-12 Months         | 6               | 6.0  | 2              | 11.80  |  |
| More than 12 months | -               | -    | 14             | 82.40  |  |
| Total               | 100             | 100  | 17             | 100.00 |  |

 Table 49: Food Sufficiency Status in Chyangra Pashmina Value Chain

Source: Baseline Survey, 2020, and Endline Survey of NLSIP, 2023

#### 3.2.12. Investment Modality

Among the 1182 households surveyed under Task-1 in 2023, about 11% of households out of 1182 households, were found to have taken loan for their livestock business, which in the baseline there were 5.36% of farm households used to take loan for livestock business, which increased by 104% in the endline. Comparing among the value chains, there were 16%, 7.4%, and 5.9% of farm households used to take loan for dairy, goat, and Chyangra Pashmina value chains, which in the baseline there were only 9%, 2%, and 2% of farm households used to take loan respectively. This shows that after the NLSIP intervention, farmers are encouraged to take loan for their livestock businesses. These results have also shown that majority of farmers (89%) used to invest in their livestock business from their own equity capital. The figures regarding investment modality has been presented in the following table.

|                      | Ba               | seline (2020)                     |                              | E                | Endline (2023)                    |                           |                                    |  |  |

Source: Baseline, 2020, and Endline Survey of NLSIP, 2023

#### 3.2.13. Management of Animal's Feeds

It was found that nearly 80% of farm households out of the 1182 surveyed households used to use green forage for their livestock, followed by concentrate feed (57%), dry forage (37.5%). Comparing among groups and cooperatives, more number of farmers of groups (86%) used to use green forage, as compared to farmers of cooperatives (60%). 59% of farmers among groups, and 49.5% of farmers among cooperatives were found using dry forage for their livestock. The results regarding the feed management for livestock at the farm levels have been presented in the following table.

| POs (Task-1) in 2023          |                 |           |                 |           |                 |        |  |  |  |  |  |
|-------------------------------|-----------------|-----------|-----------------|-----------|-----------------|--------|--|--|--|--|--|
| Types of Animal Foods         | Cooperative     | e (N=295) | Farmer group    | p (N=887) | Total (N=       | :1182) |  |  |  |  |  |

 Table 51: Management of Animal Feeds by Producer Households in all Value Chains by types of

An attempt has also been made to compare the feed management at three different value chains (dairy, goat meat and Chyangra Pashmina) and the results have been presented in the following table.

| Types of Animal Feeds | Dairy (N=       | -487) | Goat Meat (N=678) |       | Chyangra Pashmina<br>(N=17) |        |
|-----------------------|-----------------|-------|-------------------|-------|-----------------------------|--------|
| used                  | Number of<br>HH | %     | Number of HH      | %     | Number of<br>HH             | %      |
| Hay/silage            | 15              | 3.08  | 9                 | 1.33  | 16                          | 94.12  |
| Green forage          | 424             | 87.06 | 500               | 73.75 | 16                          | 94.12  |
| Dry forage            | 263             | 54.00 | 163               | 24.04 | 17                          | 100.00 |
| Concentrated feeds    | 306             | 62.83 | 366               | 53.98 | 0                           | 0.00   |
| Mineral block         | 50              | 10.27 | 23                | 3.39  | 1                           | 5.88   |
| Other                 | 46              | 9.45  | 122               | 17.99 | 0                           | 0.00   |

Table 52: Management of Animal Feeds by Producer Households by Value Chains (Task-1) in 2023

Source: Endline Survey of NLSIP, 2023

While comparing among the three value chains, Chyangra farms used to use more dry forage, hay/silage and green forage for feed, whereas, dairy and goat farms used to use more green forage, concentrates and dry forage as feed. The results regarding the feed management by value chains have been presented in the following table.

#### 3.2.14. Innovation Applied for Scaling up of Agro-Enterprises (Task-1)

The NLSIP has supported to the producers' farmers and agro-enterprises through the sub-projects for scaling up of their agribusinesses by promoting the use of new technologies and innovations. The frequency of innovation applied in the agro/livesock farms, particularly in dairy enterprise, have been illustrated in the following table below:

| Inovation applied           | Baseline<br>(N=673 | · · · · · | Endline (2023)<br>(N= 487 HHs) |          |  |
|-----------------------------|--------------------|-----------|--------------------------------|----------|--|

 Table 53: Innovation applied at livestock enterprises (Dairy) in 2023

#### 3.2.15. Quality of Products (Food Safety and Hygiene Procedures)

It has been found that majority of livestock farms, as supported by the project-NLSIP, through the component B (Task-1), were applying food safety and hygiene procedures such as, shed cleaning applied by 73% farmers, followed by livestock cleaning (50%), cleaning of utensils (41%), using boots, gloves, and aprons (30%), and cleaning of udders before milking (27%). Such results have shown that most of the farmers are aware of production of quality products in their farms. The figures regarding the food safety and hygiene procedures applied in the targeted livestock commodities in 2023 have been presented in the following table.

| Food and safety and<br>hygiene procedures<br>adapted | Cooperati<br>(N=295) | ive   |                 |       | Total<br>(N=1182) | Food and safety<br>and hygiene<br>procedures<br>adapted |
|--|----------------------|-------|-----------------|-------|-------------------|---|

#### 3.2.16. Compliance to Environmental and Social Safeguards Measures

Around half of the farmers (52%) out of total 1182 suveyed households under Task-1, were found to have constructed compost pits, 19% each farm has constructed urine pits and fencing (compound walls) as environmental and social safeguards measures. Very few farms (4.5%) have constructed drainage, and negligible number of farms (<1%) used tiles/marbles in the floor and walls. The results of the

#### 3.2.17. Access in Market Price Information

Out of total 1182 households surveyed under Task-1, máximum of farmers (70%) were found to have access to market information through their groups/cooperatives, followed by buyers/traders (2.71%). Almost 79% of dairy farmers, 63% of goat rearing farmers, and 88% of Chyangra rearing farmers used to receive market information from their groups/cooperatives. The results on the access in market price information among the three value chains as obtained from the household survey (2023), have been presented in the following able.

| Source of Market     | •               | Dairy<br>(N=487 HHs) |                 | Goat Meat<br>(N=678 HHs) |                 | Chyangra Pashmina<br>(N=17 HHs) |                 | ıl<br>HHs) |

Table 57: Access in market price information in 2023

### **3.3. Sub-Project (Matching Grant) Impact Evaluation of the Project (Task 2):**

The project had provided its grant support to 449 sub-projects during the period of implementation in three value chain commodities-dairy, goat meat and Chyangra Pashmina. Under the Call I and Call II, the project had provided grant to 213 sub-projects which were implemented individually (121 sub-projects) and collectively (93 sub-projects). Under Call III, the projects had implemented 235 sub-projects as commercial producers, especially private farms in production and processing of value chain commodities (milk, goat meat and Chyangra pashmina) and feed productions. The impact evaluation at the Sub-Project (SP) level of the Project-NLSIP, based on the data collected during the Endline Survey (2023), compared with the baseline and control sub-projects are discussed as under:

#### 3.3.1. Productivity of Targeted Livestock Commodities

The productivity of targeted livestock commodities (milk, goat meat and Chyangra Pashmina) at the sub-project levels in 2023, and compared with the baseline and the control sub-projects, are presented and discussed as under.

#### 3.3.1.1. Comparision of Productivity of Milk, Goat Meat and Chyangra Pashmina at Sub-Project Level between Baseline (Call-I and II-Individual HH level) and their Endline (2023)

The cow milk productivity at sub-project level (Call-1 &II, individual household level) during endline (2023) was found out to be 2029 litre per year per standing cattle, which increased by 73% as compared to its baseline (Call-I& II) conducted in 2021 (1174 litres) at individual households within the POs (groups/cooperatives). Similarly, the buffalo milk productivity, which was 758 litres per year per standing buffalo in baseline (2021) for Call-I and II (individual), increased to 1663 litre with increment of 119 % in Endline (2023). The goat meat productivity, measured in carcass weight, per year per standing goat in the herd at sub-project level (Call-I &II, individual) increased to 14.14 kg in Endline (2023) from 3.5 kg in baseline (2021), with 304 % increment as compared to the baseline. The figures realted to these indicators are presented in the following table.

| Value Chain<br>Commodities   | Units   | Baseline (Call-I<br>and II: Individual-<br>HH level) (2021)<br>(N=Milk:1265;<br>Goat: 563) | Endline (Call-I and<br>II: Individual-HH<br>level) (2023)<br>(N=Milk: 503;<br>Goat: 486) | Changed<br>% |
|------------------------------|---|--|--|--------------|
| Milk Productivity<br>Cattle  | Liter / Year/<br>Standing Cattle                  | 1174   | 2029   | 72.79        |
| Milk Productivity<br>Buffalo | Liter / Year /<br>Standing Buffalo                | 758  | 1663   | 119.34       |
| Goat Meat<br>Productivity    | Carcass weight in<br>Kg / Standing<br>goat / Year | $3.5^{10}$   | 14.14  | 304.00       |

### Table 58: Comparision of Productivity of Milk, Goat Meat and Chyangra Pashmina at Sub Project Level between Baseline (Call-I and II-Individual HH level) and their Endline (2023)

Source: Baseline Survey, 2021, and Endline Survey, 2023

<sup>&</sup>lt;sup>10</sup> The survey team tried to verify this figure as in the case of baseline survey of 2020, but not yet be able to find out. As soon as the baseline data for Call-I&II found, it will be updated accordingly.

#### Reasons for increased productivity in Call-I&II at Individual Household level:

The causes for the almost 73% rise in cow milk productivity, as seen in the above table, are that the herd size of cows—both local and improved—grew by 22% in 2023, as compared to baseline. Furthermore, in the same year, the number of lactating cows in the herd grew by 84%. Additionally, longer lactation periods (3.8% for local cows and 3.3% for improved cows) were linked to the high milk productivity, which raised milk production per household by 124% in 2023 compared to the baseline (2021). The accompanying table displays the supporting figures of survey results.

#### Table 59: Comparison of Herd Size, Milk Produciton, and Lactation Period of Cow in Individual Households under Call-I and II Sub-projects between Baseline (2021) and Endline (2023)

|      | (2023)                                   |                       |                                |                              |             |  |  |

Source: Baseline Survey, 2021, and Endline Survey of NLSIP, 2023

Similarly, the herd size of lactating buffalo increased by 77%, lactation length increased by approximately 3%, and the overall herd size increased by 2%, with a greater proportion of improved to local buffalo (i.e., 4.7:1.5). These factors contributed to the 119% increase in buffalo milk productivity, which increased the amount of milk produced per household from 3482 liters to 8005 liters from baseline (2021) to endline (2023). The following table compares the herd size, milk output, lactation period, and other parameters of buffalo milk production between the baseline and endline.

### Table 60: Comparison of Herd Size, Milk Produciton, and Lactation Period of Buffalo in Individual Households under Call-I and II Sub-projects between Baseline (2021) and Endline

In the case of goats as well, individual sub-projects of the project that intervened in the goat value chain contributed 304% of the increase in production, with an average of 14 more goats added to the herd per household. As a result, with a 128% increase, the herd size per household that received project funding increased to 25 in 2023 from just 11 in the baseline (2021). This substantial increment of herd size had positive impact on the meat production per household, which was 73 Kg (on live weight) in baseline (2021) increased to 553 Kg in the year 2023 (endline), with 659% of increment within two years. The results on the herd size and meat production per household, who received grant under Call-I and II, and implemented individually, compared between baseline and endline, have been presented in the following table.

| S.N. | Indicators                                | Units       | Baseline, 2021<br>(N= 563) | Endline, 2023<br>(N=486) | Increased % |

### **3.3.1.2.** Comparison of Productivity of Milk, Goat Meat and Chyangra Pashmina at Sub-Project Level between Baseline (Call-I and II: Collective) and their Endline (2023)

The cow milk productivity at sub-project level (Call-1 &II, collective/PO level) during endline (2023) was found out to be 2104 litre per year per standing cattle, which increased by 98% as compared to its baseline (Call-I & II) conducted in 2021 (1063 litres). Similarly, the buffalo milk productivity, which was 587 litres per year per standing buffalo in baseline (2021) for Call-I and II (collective/PO level), increased to 1482 litre with increment of 152 per cent in Endline (2023). The goat meat productivity, measured in carcass weight, per year per standing goat in the herd at sub-project level (Call-I &II, collective/PO level) increased to 15.02 kg in Endline (2023) from 3.56 kg in baseline (2021), with 322 % of increment as compared to the baseline. The figures realted to these indicators are presented in the following table.

| Value Chain<br>Commodities   | Units   | Baseline (Call I<br>and II: Collective)<br>(2021)<br>(N=Milk:124;<br>Goat:73) | Endline (Call-I<br>and II:<br>Collective) (2023)<br>(N=Milk:117;<br>Goat: 65) | Changed % |

### Reasons for increased productivity in Call-I&II (Collective SP) level:

The causes for the about 98% rise in cow milk productivity, as indicated in the above table, are that the herd size of cows, both locally and improved per PO to around 51, rose by 52% in 2023 compared to baseline (33). Furthermore, with a 107% increase, the herd number of nursing cows per PO—which was around 16 at baseline—rose to approximately 33 in 2023. Moreover, a 10% increase in the enhanced cow's lactation time was linked to the high milk productivity of the POs, which raised milk output per PO by 93% in 2023 compared to the baseline (2021). These supporting figures, which helped to explain the higher cow milk productivity, provided by the PO, have been presented in the table below.

Table 63: Comparison of Herd Size, Milk Produciton, and Lactation Period of Cow in POs under Call-I and II Sub-projects between Baseline (2021) and Endline (2023)

Source: Baseline Survey, 2021, and Endline Survey of NLSIP, 2023

The herd size of improved buffalo was around 32, and the ratio of improved to local buffalo was high (32:7), meaning that there were more improved buffalo and fewer local buffalo in the herd. These factors contributed to the 152% rise in buffalo milk yield in 2023. High productivity was seen as a result of reduced herd size and greater milk output per PO. This was made possible by the introduction of novel technology into the dairy industry through the implementation of sub-projects.

The comparison of herd size, milk production, lactation perioed and other indicators regarding buffalo milk production at PO level under Call-I and II, between baseline and endline has been presented in the following table.

Table 64: Comparison of Herd Size, Milk Produciton, and Lactation Period of Buffalo in POsunder Call-I and II Sub-projects between Baseline (2021) and Endline (2023)

In the case of goats, too, the project's involvement in the goat value chain as grant sub-projects run cumulatively resulted in a 322% increase in productivity in 2023, with an average 15% increase each PO. Meat production was positively impacted by the POs' adoption of improved and climate-smart technology as well as by increasing the number of their herds. The average meat production per PO jumped by 330% in just two years, from 995 kg (on live weight) in the baseline (2021) to 4281 kg (endline) in 2023. The results on the herd size and meat production per PO, which received grant under Call-I and II, and implemented collectively, compared between baseline and endline, have been presented in the following table.

#### 3.3.1.3. Comparison of Productivity of Milk, Goat Meat and Chyangra Pashmina at Sub-Project Level between Baseline (Call-III: Private Farms) and their Endline (2023)

The cow milk productivity at sub-project level (Call-III, private farm) during endline (2023) was found out to be 2200 litre per year per standing cattle, which increased by 39% as compared to its baseline (Call-III, private farm) conducted in 2022 (1583 litres) at private farms. Similarly, the buffalo milk productivity, which was 827 litres per year per standing buffalo in baseline (2022) for Call-III (private farms), increased to 1534 litres with increment of 85 per cent in Endline (2023). The goat meat productivity, measured in carcass weight, per year per standing goat in the herd at sub-project level (Call-III, private farms) increased to 17.37 kg in Endline (2023) from 3.81 kg in baseline (2022), with 356 % of increment as compared to the baseline. The figures realted to these indicators are presented in the following table.

<sup>&</sup>lt;sup>11</sup> The survey team tried to verify this figure of the baseline survey of 2022 for Private farms, but not yet be able to find out.

#### Reasons for increased productivity in Call-III at Private Farm level:

The herd size of improved cow per private farm grew by 97% in the year 2023 compared to baseline (19), which is the explanation for the approximately 39% rise in milk output of cows given in the above table. Furthermore, the herd size of nursing cows per private farm grew by 181% from 8.64 in the baseline (2022) to 24.27 in 2023. These circumstances led to a high level of cow milk output among private farms, which rose by 186% in 2023 compared to the baseline and therefore increased cow milk productivity. The supporting figures that hekped explain the increased cow milk productivity at the private farm level, as obtained from the institutional survey, 2023, have been presented in the following table.

| S.N. | Indicators                               | Units              | Baseline,<br>2021<br>(N=189) | Endline,<br>2023<br>(N=152) | Increased % |

Table 67: Comparison of Herd Size, Milk Produciton, and Lactation Period of Cow in PrivateFarms under Call-III Sub-projects between Baseline (2022) and Endline (2023)

Source: Baseline Survey, 2022, and Endline Survey of NLSIP, 2023

Similarly, for buffalo milk productivity, which increased by 85%, because of the reasons that total herd size of buffalo per private farm, which was 19 in the baseline, increased to around 31 in 2023, with increment of 61%. At the same time, herd size of improved buffalo increased by 54% in endline as compared to the baseline. Furthermore, the herd size of lactating buffalo increased from 8 in baseline to 19 in the endline with increment of 138%. These facts contributed to the increased milk production per private farm by 199%, eventually contributed to the increased buffalo milk productivity among the private farms. Such increment of milk production among the private farms was due to the project's interventions such as livestock health, management of sheds, feeds, promotion of forage and fodders, adoption of climate smart agricultural technologies at the farm levels, and so on.

The comparison of herd size, milk production, lactation perioed and other indicators regarding buffalo milk production at Private Farm level under Call-III, between baseline and endline has been presented in the following table.

|      | Farms under Can-III Sub-projects between Dasenne (2022) and Endine (2023) |                             |                           |                          |             |  |

In case of goat also, 356% of increment of productivity was due to increase in herd size in 2023, with 265% increment, on an average per Private Farm, where herd size of cross-bred increased by 125% and purebred/exotic by 26%. The live weight meat production per farm, which was 294 kg in the baseline, increased to 3336 kg in the endline. Such significant increment in the herd size gave rise to meat production, which ultimately contributed to the increased goat meat productivity. The increased goat meat production per farm and productivity of goat were due to project's intervention in the goat value chain as grant sub-projects under call-III run by the private farms.

The results on the herd size and meat production per private farm, which received grant under Call-III, compared between baseline (2022) and endline (2023), have been presented in the following table.

| Sub-projects between Baseline (2022) and Endline (2023) |   |               |                           |                          |             |  |

### **3.3.1.4.** Comparison of Productivity of Milk, Goat Meat and Chyangra Pashmina at Sub-Project Level between Treatment (2023) and Control (2023) (PO level comparison)

In this section, an attempt has been made to compare the productivity of milk and goat meat between PO levels Endline (2023) with PO levels Control (2023).

The cow milk productivity at PO levels in 2023 (Endline: Treatment) is 7 % more than that of its Control POs, showing productivity of 2050.27 litres per year per standing cattle, as compared to control POs (1918.83 litres).

The buffalo milk productivity at PO levels in Endline Treatment in 2023, was found out to be 44 % more than that of its Control POs, showing higher productivity (1358.75 litres per year per standing buffalo) in treatment POs as compared to Control POs (942.72 litres per year per standing buffalo) in 2023.

Similarly, Goat meat productivity, measured in carcass weight, at PO levels in Endline Treatment in 2023 was found out to be 7.5 % more than that of its Control POs, showing slightly higher productivity (15.76 Kg per standing goat per year) in treatment POs as compared to Conrol POs (14.66 Kg per standing goat per year).

Details of productivity of targeted livesock commodities at PO levels in 2023, compared between treatment and control, and has been presented in the following table.

| Project (POs) Level between Treatment (2023) and Control (2023) |   |  |   |                                   |             |  |  |  |  |
|---|---|--|---|-----------------------------------|-------------|--|--|--|--|
| Value Chain<br>Commodities                                      | Units   | Treatment (PO<br>level) (2023)<br>(N=Milk: 117;<br>Goat: 65) | Control (PO<br>level) (2023)<br>(N=Milk: 18;<br>Goat: 14) | % of<br>Treatment<br>over Control | P-<br>Value |  |  |  |  |
| Milk Productivity<br>Cattle                                     | Liter/Year/Standing<br>Cattle                 | 2050.27  | 1918.83   | 106.85                            | 0.42        |  |  |  |  |
| Milk Productivity<br>Buffalo                                    | Liter/Year/Standing<br>Buffalo                | 1358.75  | 942.72  | 144.13                            | 0.965       |  |  |  |  |

Table 70: Comparison of Productivity of Targeted Livestock Commodities at Sub-<br/>Project (POs) Level between Treatment (2023) and Control (2023)

Source: Endline Survey, 2023

#### **Reasons for increased productivity in Treatment POs over Control POs:**

As shown in table above, the cow milk productivity was around 7% more in treatment POs over the control POs was because of the reasons that herd size of improved cow per PO was 81% more than that in the control POs. Total herd size in treatment POs was 25% more than that in the control POs and herd size of lactating cow was also higher (16%) in treatment POs over the control POs. In addition, lactation lengths of both local and improved cow were higher in treatment POs than in the control POs. Because of these, the milk production and productivity in treatment POs were found to be higher than in the treatment POs. Such increment of production and productivity of cow milk in the treatment POs was recorded to be higher due to project's interventions such as distribution of improved cattle, promotion of climate smart agricultural technologies, vaccination against FMD, disease and parasite control programs, management of sheds, promotion of forage and fodder for balance feed to the livestocks and so on. The figures contributed to the increased cow milk production and productivity at the PO level, as obtained from the institutional survey, 2023, both for treatment and control POs, have been presented in the following table.

| Treatment 1 05 under Can-1 & 11 Sub-projects and Control 1 05 in 2025 |  |                       |                               |                            |                             |         |  |

| 6   | Lactation length (local cow)                   | Days/Lactating<br>cow | 270.00                        | 255.00                     | 105.88                      | 0.066   |  |
| 7   | Lactation length<br>(improved cow)             | Days/Lactating<br>cow | 286.15                        | 280.00                     | 102.20                      | 0.165   |  |

Table 71: Comparison of Herd Size, Milk Produciton, and Lactation Period of Cow betweenTreatment POs under Call-I & II Sub-projects and Control POs in 2023

Similarly, the overall herd size of buffalo per treatment PO was 19% larger than that of the control PO, which contributed to the 44% increase in buffalo milk productivity in treatment POs compared to control POs. However, there were 90% and 20% more and lactating buffalo in treatment POs than in control POs, respectively. Due to these factors, the treatment POs' milk output per buffalo was 84% higher than that of the control POs. These factors played a part in the POs' higher milk production, which in turn helped the POs' greater productivity with regard to buffalo milk. The adoption of upgraded livestocks and other project interventions were the reason for the increase in milk output among the POs.

Similarly, for buffalo milk productivity, which in treatment PO was 44% more over the control POs, because of the reasons that total herd size of buffalo per treatment PO was 19% more with respect to control PO. Whereas number of improved buffalo and lactating buffalo were 90% and 20% more in treatement POs over the control POs respectively. Because of these factors, the milk production of buffalo per PO was 84% more in the treatment POs as compared to the control POs. These factors contributed to the increased milk production among the POs, which eventually contributed to the increased buffalo milk productivity among the POs. The project's interventions, such as the addition of better livestocks to the herd, the vaccination and treatment program for livestock health, the management of sheds and feeds, the promotion of climate-smart agricultural technologies, and the promotion of forage and fodders, are all responsible for the increase in milk production among the POs.

The comparison of herd size, milk production, lactation period and other parameters regarding buffalo milk production at PO level under Call-I & II, between treatment and control have been presented in the following table.

| freument i os under our i tu i ouo projects und control i os in 2020. |  |                           |                               |                            |                             |         |

| Table 72: Comparison of Herd Size, Milk Produciton, and Lactation Period of Buffalo between |
|---|
| Treatment POs under Call-I & II Sub-projects and Control POs in 2023:                       |

The aforementioned table illustrates that, at the five percent probability level, the herd size of enhanced buffalo in treatment households was much larger than that of control families. On the other hand, treated households produced much more milk buffalo milk per PO annually than did control households. The introduction of exotic or pure breed goats into the herds in the treatment POs, together with a notable rise in the size of local and improved goat herds, contributed to the 7.5% improvement in production in goat cases compared to control POs. As a result, the herds at PO level saw a considerable reduction in goat meat, both in terms of live and carcass weight (more than 500% as opposed to productivity).

Meat production resulted from these parameter increases in the goat herds at the treatment PO level, and this ultimately helped to raise goat meat productivity in comparison to the control POs. The project's intervention in the goat value chain as grant sub-projects under call-I & II conducted by producers organizations (POs) was the cause of the improved productivity of goats and the amount of meat produced per farm.

The following table compares the outcomes of treatment and control groups for the herd size and meat output per PO that was awarded grants under Calls I and II.

|      | Call-I & II Sub-projects and Control POs in 2023: |             |                              |                            |                             |         |  |  |  |  |  |

 Table 73: Comparison of Herd Size and Meat Produciton of Goat between Treatment POs under

 Call-L & II Sub-projects and Control POs in 2023:

Source: Endline Survey of NLSIP, 2023

As can be seen from the above table, at the one percent probability level, every parameter in the treatment households for goat rearing was considerably higher in 2023 than in the control households.

#### 3.3.1.5. Comparison of Productivity of Milk, Goat Meat and Chyangra Pashmina at Sub-Project Level under Call-III Treatment (2023) and Control (2023) (Private Farm level comparison)

In this section, an attempt has been made to compare the productivity of milk and goat meat at subprojects levels between Treatment Private Farms with Control Private Farms in 2023.

The cow milk productivity per standing livestock per year at Private farms in 2023 (Endline: Treatment) is 2199.94 liters, which is about 6 % more than that of its Control Private farms (2077.39 litres).

The buffalo milk productivity per standing livestock per year in the treatment private farms was found 7% higher (1534 litres) over the control private farms (1433 litres) in year 2023.

Goat meat productivity, measured in carcass weight, at treatment private farms in 2023 was found out to be 108 % over its control private farms, showing 8 % higher productivity (17.37 Kg per standing goat per year) in treatment private farms as compared to control private farms (16.06 Kg per standing goat per year).

Details of productivity of targeted livestock commodities at private farm levels in 2023, compared between treatment and control, and has been presented in the following table.

| Farms) Level between Treatment (2023) and Control (2023) |   |  |  |                                      |             |  |  |  |
|--|---|--|--|--------------------------------------|-------------|--|--|--|
| Value Chain<br>Commodities                               | Units   | Treatment<br>(Private Farm<br>level) (2023)<br>(N=Milk: 152;<br>Goat: 101) | Control<br>(Private Farm<br>level) (2023)<br>(N=Milk: 99;<br>Goat: 42) | % of<br>Treatment<br>over<br>Control | P-<br>Value |  |  |  |
| Milk Productivity<br>Cattle                              | Liter/Year/Standing<br>Cattle                 | 2199.94  | 2077.39  | 105.90                               | 0.606       |  |  |  |
| Milk Productivity<br>Buffalo                             | Liter/Year/Standing<br>Buffalo                | 1533.80  | 1433.28  | 107.01                               | 0.031       |  |  |  |
| Goat Meat<br>Productivity                                | Carcass weight in<br>Kg/Standing<br>goat/Year | 17.37  | 16.06  | 108.16                               | 0.213       |  |  |  |
| Chyangra Pashmina<br>Productivity                        | Gram/Chyangra/Year                            | -  | -  | -                                    |             |  |  |  |

Table 74: Comparison of Productivity of Targeted Livestock Commodities at Sub-Project (Private<br/>Farms) Level between Treatment (2023) and Control (2023)

Source: Endline Survey, 2023

From above table it can be seen that the buffalo milk productivity in treatment private farms in 2023 was significantly higher than that of the control private farms in the same year at 5 per cent level of probability.

#### Reasons for increased productivity in Treatment Private Farms over Control Private Farms:

As shown in above table, the cow milk productivity was around 6% more in treatment Private farms over the control Private farms was because of the reasons that herd size of improved cow per Private Farm was 129% more than that in the control Private Farm. Total herd size in treatment Private Farms was 126% more than that in the control Private Farms, and herd size of lactating cow was also higher (124% more) in treatment Private Farms over the control Private Farms. These facts contributed to the increased cow milk production in the treatment private farms (81,899 liter per year), where in the control private farms, it was only 30,948 liter per year, recorded in the same year 2023. Such increment in the parameters of the milk production in the privae cattle farms significantly contributed to the productivity in treatment private farms, which received grant sub-projects under call-III. In fact, the poject's intervention on introduction of improved cattle, promotion of climate smart agricultural technologies, vaccination, disease and parasite control programs, management of sheds, promotion of forage and fodder for balance feed to the livestocks and many more activities contributed to the increased cow milk productivity at the Private Farm level, as obtained from the institutional survey, 2023, both for treatment and control farms, have been presented in the following table.

| S.N. | Indicators                                     | Units                      | Treatment,<br>2023<br>(N=152) | Control,<br>2023<br>(N=99) | Treatment %<br>over Control | P-Value |

 Table 75: Comparison of Herd Size, Milk Produciton, and Lactation Period of Cow between

 Treatment Private Farms under Call-III Sub-projects and Control Private Farms in 2023

Source: Endline Survey of NLSIP, 2023

From above table, it can be seen that the herd size of improved cow, herd size of local and improved cow in agreegate, and herd size of lactating cow (local and improved) in the treatment households were significantly higher than that of the control households at 1 per cent level of probability. The per household cow milk production in the treatment households was also significantly higher than that in the control households at 5 per cent level of probability in the year 2023.

Similarly, the overall herd size of buffalo per treatment private farm was 113% larger than that of control private farms, which accounted for the 7% increase in buffalo milk productivity in the treatment private farm compared to the control private farm.

Because of these factors, the milk production of buffalo per Private Farm was recorded to be 128% more in the treatment Private Farms as compared to the control Private Farms. These facts contributed to the increased milk production among the Private farms, which eventually contributed to the increased buffalo milk productivity among the Private farms, those supported by the NLSIP. Such increment of buffalo milk production and productivity among the Private Farms were due to the project's interventions such as introduction of improved livestocks in the herd, livestock health care program through vaccination and treatment, management of sheds, feeds, promotion of forage and fodders, promotion of climate smart agricultural technologies, and so on.

The comparison of herd size, milk production, lactation period and other parameters regarding buffalo milk production at Private Farm levels under Call-III, between treatment and control have been presented in the following table.

| S.N. | Indicators                                   | Unit                       | Treatment,<br>2023<br>(N=152) | Control,<br>2023<br>(N=99) | Treatment %<br>over Control | P-Value |

| 7    | Lactation length<br>(Improved)               | Days/Lactating<br>buffalo  | 256.8                         | 257.05                     | 99.90                       | 0.900   |

Table 76: Comparison of Herd Size, Milk Produciton, and Lactation Period of Buffalo betweenTreatment Private Farms under Call-III Sub-projects and Control Private Farms in 2023

Source: Endline Survey of NLSIP, 2023

It can be seen from the above table that the herd size of improved buffalo, herd size of local and improved buffalo in agreegate, herd size of lactating buffalo (local and improved) and milk production per private farm were significantly higher than that of the control households at 1 per cent level of probability in the year 2023.

In case of goat also, 8.16% more productivity in treatment Private Farms with respect to control Private Farms, was due to significant increase (110% more) of herd in treatment private goat farms as compared to the control private famrs, with introduction of pure/exotic breed, cross breed, and the local breed also. As such, there was significant inrement of goat meat, both in terms of live and carcass weight, in the herds at Private Farm level (118% more as compared to production at control POs). These increment of parameters in the herds of goat at the treatment Private Farm levels gave rise to goat meat production, which ultimately contributed to increased goat meat productivity as compared to the control Private Farms. The increased goat meat production per farm and productivity of goat were due to project's

interventions in the goat value chain as grant sub-projects under call-III run by the private goat entrepreneurs.

The results on the herd size of goat and meat production at Private Farms, which received grant under Call-III, compared between treatment and control, have been presented in the following table.

|      | Farms under Call-III Sub-projects and Control Private Farms in 2023: |                          |                               |                            |                          |         |  |  |

Table 77: Comparison of Herd Size and Meat Produciton of Goat between Treatment PrivateFarms under Call-III Sub-projects and Control Private Farms in 2023:

Source: Endline Survey of NLSIP, 2023

In case of goat meat, the herd size of local goat, herd size of cross-bred goat, herd size of exotic/pure breed of goat, herd size of all types of goat and meat production (on live weight basis) per private farm in the treatment private goat farms were significantly higher than that of the control goat farms during the endline year (2023) at 1 per cent level of probability. Average goat meat on carcass weight in treatment private farms was substantially higher than that in the control private farms in 2023.

#### Key Drivers of the Productivity

In summary, and in nutshell, key drivers of the productivity with figures, compared between treatment and control sub-projects in 2023, along with the P-values, have been presented in the following table.

| Table 78: Key Drivers of the Productivity at Sub-projects Level compared between Treatment | ł |

| B.4   | Total Herd Size  | 301.66 | 127.95          | 51.50  | 61.05           | 0.000        | 0.000                     |  |

Note: The above parameters have already been discussed in the earlier sub-sections.

#### 3.3.2. Sales Value of targeted Livestock Commodities at Sub-Project (SP) level (Task 2)

In this section, results of sales value of targeted livestock commodities at sub-project (SP) level (Task-2) are presented and discussed.

#### 3.3.2.1. Comparison of Sales Value of Targeted Livestock Commodities at Sub-Project (SP-Individual) Level between Baseline (2021) and Endline (2023)

The value of milk sale at sub-projects levels (individual HHs) of Call I and II during Endline (2023) was found out to be NRs. 750480 (at current price) and Rs. 678000 after adjusting the inflation, which was NRs. 313000 in baseline (2021), increased by 117 %, as compared to the baseline sales value.

Similarly, the value of goat sale at individual sub-projects level during Baseline (2021) which was NRs. 77250, increased to NRs. 155000 at current price, and Rs. 140000 after adjusting the inflation, during Endline (2023), with net increment of 81 %. The results on the sales value of targeted livestock commodities at individual sub-project levels obtained in 2023, compared with the baseline (2021) have been presented in the following table.

### Table 79: Comparision of Sales Value of targeted Livestock Commodities at Sub-Project (SP)level between Baseline (2021) and Endline (2023) (Individual)

| Value Chain                     | Call I & Call II Sub-<br>Project (Individual)<br>(Baseline, 2021) | Call I & Call II<br>(Individual) (Er<br>(N=Milk: 503; | ndline, 2023)                                 | Increased % <sup>12</sup> |
|---------------------------------|---|---|---|---------------------------|
| Commodities                     | (N=Milk: 1265; Goat:<br>563)                                      | At cuurent<br>price                                   | After<br>adjusting<br>inflation <sup>13</sup> | increaseu 70              |
| Milk Sales (Rs., 000)<br>per HH | 312.8   | 750.48  | 678.06  | 116.77                    |
| Goat Sales (Rs., 000)<br>per HH | 77.25   | 154.93  | 139.98  | 81.20                     |

Source: Baseline Survey, 2021, and Endline Survey, 2023

The significant increase in the sales value of milk and goat were due to increase in household level production and sales quantity. On an average, an individual farmer used to sell 8,380 liters of milk per year, recorded in 2023, which was 4923 liters in 2021. Due to such increase in production and quantity of sales from baseline to endline, the value of sales of milk has also been increased. Similarly for goat meat, there was an average household goat meat production (on carcass weight) of 47.35 kg in 2021, increased to 359.42 kg in 2023. Because of this the sales value of goat meat has also been increased. The figures on household (individual) level sales of milk and goat meat in 2023, and compared with baseline (2021) have been presented in the following table.

<sup>&</sup>lt;sup>12</sup> % Increased has been computed by comparing the baseline values with endline values after adjusting the inflation

<sup>&</sup>lt;sup>13</sup> The inflation adjustment was done based on the consumer price index (CPI) of 2021@ 206, and 2023@228

# 3.3.2.2. Comparison of Sales Value of Targeted Livestock Commodities at Sub-Project (SP-Collective/PO level) Level between Baseline (2021) and End-line (2023)

The value of milk sale at sub-projects levels (collective/PO level) of Call I and II during Endline (2023) was found out to be NRs. 9.74 million at current price and Rs. 8.8 million after adjusting the inflation, which was NRs. 6.77 million in baseline (2021), increased by 30 %, as compared to the baseline sales value.

Similarly, the value of goat sale at collective sub-projects at PO level during Baseline (2021) which was NRs. 817 thousand, increased to NRs. 3447 thousand at current price and Rs. 3114 thousand during Endline (2023) after adjusting the inflation, with increment of 281%. This has been presented in the following table.

| Table 81: Comparison of Sales Value of targeted livestock commodities at Sub-Project (SP) level |
|---|
| Between Baseline (2021) and End-line (2023) (Collective/PO level)                               |

| Value Chain<br>Commodities      | Call I & Call II Sub-<br>Project (Collective/PO<br>level) (Baseline, 2021)<br>(N=Milk: 124; Goat:<br>73) | (Colle)<br>(Endline, 2 | cuurent After adjusting inflation <sup>15</sup> |        |
|---------------------------------|--|------------------------|---|--------|
| Milk Sales (Rs., 000)<br>Per PO | 6770   | 9741                   | 8801  | 30.00  |
| Goat Sales (Rs.,000)<br>Per PO  | 816.69   | 3447                   | 3114.39   | 281.34 |

Source: Baseline Survey, 2021, and Endline Survey, 2023

<sup>&</sup>lt;sup>14</sup> % Increased has been computed by comparing the baseline values with endline values after adjusting the inflation

<sup>&</sup>lt;sup>15</sup> The inflation adjustment was done based on the consumer price index (CPI) of 2021@ 206, and 2023@228

Such increment of value of milk sale and goat meat sale was due to increased in milk and goat meat production respectively at the sub-project level implemented collectively, which has been mentioned and discussed above.

#### 3.3.2.3. Comparison of Sales Value of Targeted Livestock Commodities at Sub-Project (SP-Private Farm) Level between Baseline (2022) and End-line (2023)

The value of milk sale at sub-projects levels (private farms) of Call III during Endline (2023) was found out to be NRs. 10.17 million at current price and Rs. 9.77 million after adjusting the inflation, which was NRs. 6.26 million in baseline (2022), increased by 56 %, as compared to the baseline sales value.

Similarly, the value of goat sale at individual sub-projects level during Baseline (2022) which was NRs. 435 thousand, increased to NRs. 712.5 thousand at current price and Rs. 684.3 thousand after adjusting the inflation during Endline (2023), with increment of 57 %. This has been presented in the following table.

### Table 82: Comparison of Sales Value of targeted Livestock Commodities at Sub-Project (SP) level between Baseline (2022) and End-line (2023) (Private Farm)

| Value Chain                       | Call-III Sub-Project<br>(Private Farm) (Baseline, | Call-III Sub-Pr<br>Farm) (End<br>(N=Milk: 152 | line, 2023)                                   | Increased % <sup>16</sup> |
|-----------------------------------|---|---|---|---------------------------|
| Commodities                       | 2022) (N=Milk: 189;<br>Goat: 163)                 | At cuurent price                              | After<br>adjusting<br>inflation <sup>17</sup> | nicreased 70              |
| Milk Sales (Rs., 000)<br>per Farm | 6264.6  | 10,172.92                                     | 9771.36                                       | 55.98                     |
| Goat Sales (Rs.,000)<br>per Farm  | 434.9   | 712.46  | 684.34  | 57.35                     |

Source: Baseline Survey, 2022, and Endline Survey, 2023

Such increment of value of milk sale and goat meat sale was due to increased in milk and goat meat production respectively at the sub-project level implemented by private farms. which has been mentioned and discussed above.

### 3.3.2.4. Comparison of Sales Value of Targeted Livestock Commodities at Sub-Project (SP) Level between Treatment and Control POs in 2023 (PO level comparison)

The value of milk sales per treatement POs under Call-I and II was recorded to be NRs. 9.74 million, which was only 4.12 million in control POs during 2023, which is 136% more of the milk sale at control POs measured as 100.

Similarly, the goat sales values in treatment POs under the Call-I and II, was found out to be NRs. 3447 thousand, as compared to only NRs. 319 thousand in the control POs.

The figures of comparison between treatment POs of Call-I and II, and control POs have been presented in the following table.

<sup>&</sup>lt;sup>16</sup> % Increased has been computed by comparing the baseline values with endline values after adjusting the inflation

<sup>&</sup>lt;sup>17</sup> The inflation adjustment was done based on the consumer price index (CPI) of 2022@ 219, and 2023@228

| Value Chain<br>Commodities      | Call-I&II Sub-Projects<br>(Treatment POs) (2023)<br>(N=Milk: 117; Goat: 65) | Control POs<br>(2023) (N=Milk:<br>18; Goat: 14) | % of Treatment<br>over Control | P-<br>Value |
|---------------------------------|---|---|--------------------------------|-------------|
| Milk Sales (Rs., 000)<br>per PO | 9741  | 4121  | 236.37                         | 0.085       |
| Goat Sales (Rs.,000)<br>per PO  | 3447  | 319   | 1080.56                        | 0.033       |

## Table 83: Comparison of Sales Value of targeted Livestock Commodities at Sub-Project (SP)level between Treatment POs of Call-I & II and Control POs in 2023

Source: Endline Survey, 2023

Such higher value of milk sale and goat meat sale in treatment POs over the control POs was due to increased in milk and goat meat production respectively at the PO level, which has been mentioned and discussed above. The average sales value of goat in the treatment POs during 2023 was significantly higher than in the control POs at 5 per cent level of probability in the same year. Similarly the average sales value of milk in treatment POs was substantially higher than in the control POs during the endline period.

## **3.3.2.5.** Comparison of Sales Value of Targeted Livestock Commodities at Sub-Project (SP) Level between Treatment and Control Private Farms in 2023 (Private Farm level comparison)

The value of milk sales per treatement private farm under Call-III was recorded to be NRs. 10.17 million, which was 286 % of the value of milk sales per control private farm (measured as 100) during 2023. This was because of increased milk production at treatment private farms as compared to the control private farms i.e. 164% more in cow milk and 128% more in buffalo milk production than that in control private farms.

But, the goat sale values in treatment private farms under the Call-III, was found out to be 712.4 thousand which is only 77 % of the goat sale values at control private farms in 2023. This is because the goat producing private farms (treatment) could sell only 1145.66 kg live weight out of total production of 3336.18 kg per farm, which is only 34% of the production, whereas in control private farm, they could sell about 91% (1387 kg out of 1531 kg) of the production in the year 2023.

The figures of comparison between treatment private farms of Call-III, and their control private farms have been presented in the following table. The below table depicts that the sales values of milk in the treatment private farms were substantially higher than in the control private farms during the endline period.

| Value Chain<br>Commodities        | Call-III Sub-Projects<br>(Treatment Private Farms)<br>(2023) (N=Milk: 152; Goat:<br>101) | Control Private<br>Farms<br>(2023) (N=Milk:<br>99; Goat: 42) | % of Treatment<br>over Control | P-<br>Value |
|-----------------------------------|--|--|--------------------------------|-------------|
| Milk Sales (Rs.,<br>000) per Farm | 10,172.92  | 3,558.12   | 285.91                         | 0.059       |
| Goat Sales<br>(Rs.,000) per Farm  | 712.46   | 927.8  | 76.79                          | 0.432       |

#### 3.3.3. Adoption of Climate Smart Agriculture Technology (CSAT) at Sub-project level (Task-2)

The Project has promoted seven types of climate smart agricultural technologies (CSATs) in the Project command áreas, through various types of sub-projects under Call-I, II and III, and the results obtained from the endline survey, compared with the baselines and controls have been presented and discussed in the following sections.

#### 3.3.3.1. Climate Smart Agriculture Technology (CSAT) in Call-I and II (Individual HH level)

The adoption of climate smart agricultural technologies (CSATs) in Call-I and II sub-projects, which were implemented by individual households are presented and discussed in the following sub-sections.

### 3.3.3.1.1. Climate Smart Agriculture Technology (CSAT) Adoption in at Individual HH level compared between cooperatives and farmers' groups in all three value chains in 2023

About 95 % of households out of 1053 sampled households within cooperatives and farmers' groups, in Call I and II, found to have adopted improved shed management practices, followed by manure management (83%), fodders, forage production and pasture development (50%), and least in saplings/seedlings production (0.38%). Similar scenario could be seen among cooperatives and farmers' groups, showing very little variations between cooperatives.

| CSAT applied at HH level in                           | Cooper<br>(N=610            |       | Farmer C<br>(N=443          | -     | Total (1053 HHs)            |       |  |
|---|-----------------------------|-------|-----------------------------|-------|-----------------------------|-------|--|
| Call-I & II   | Number of<br>HH<br>adopting | %     | Number of<br>HH<br>adopting | %     | Number of<br>HH<br>adopting | %     |  |
| Improved shed management                              | 577                         | 94.59 | 425                         | 95.94 | 1002                        | 95.16 |  |
| Manure management                                     | 516                         | 84.59 | 362                         | 81.72 | 878                         | 83.38 |  |
| Fodders, Forage Production<br>and Pasture Development | 345                         | 56.56 | 185                         | 41.76 | 530                         | 50.33 |  |

Table 85: Climate Smart Agriculture Technology Adoption at Household levels in all threeValue Chains at Sub-project level (Individual) in 2023

Source: Endline Survey, 2023

# 3.3.3.1.2. Number of Farmers adopting Climate Smart Agriculture Technology (CSAT) in all three Value Chains at Sub-project level (Individual Households) in 2023

There are 100 % farmers in Call-I and II (individual sub-projects) who used at least one technology, which was 94.19% in the baseline (2021). Whereas, 89% of farmers in 2023 used at least two technologies, which was 75% in 2021, and 57 % used at least three technologies in 2023 which was 52% in 2021. These figures are more or less same in case of households within cooperatives and farmers' groups in 2023. The figures on the number of farmers adopting CSAT in all three value chains in cooperatives and farmers' groups in 2023, which are compared with the baseline value irreseptive of types of POs, have been presented in the following table.

#### 3.3.3.1.3. Climate Smart Agriculture Technology (CSAT) Adoption in Targeted Livestock Commodities at Sub-project level (Individual HH level) in 2023

Among seven CSATs promoted by the project, most of the farmers of Call I and II sub-projects, were found adopting improved shed management technology, which 100% in Chyangra Pashmina, 99% in Goat Meat, and 90% in Dairy Value Chains in 2023. The second important CSAT is the manure management, for which 88% in Dairy, 83% in Goat Meat, and 47% in Chyangra Pashmina rearing farmers were found adopting this technology. Around 50% of farmers of all three value chains used to adopt fodders, forage production and pasture development technologies. The figures on the CSAT apoption by the farmers in all three value chains in 2023 have been presented in the following table.

| CSAT  | Dairy<br>(N=503 HHs) |       | Goat Meat<br>(N=486 HHs) |       | Chyangra<br>Pashmina<br>(N=64 HHs) |        | Total<br>(N=1053 HHs) |       |
|---|----------------------|-------|--------------------------|-------|------------------------------------|--------|-----------------------|-------|

# 3.3.3.1.4. Number of Farmers adopting Climate Smart Agriculture Technology at Sub-project level (Individual Households) by Value Chains in 2023

Comparing among value chains on the adoption of the CSATs in 2023, 100% of the individual households used to adopt at least one CSAT in their livestock farms. 92% of dairy farmers used to adopt at least two CSATs, followed by Goat producing farmers (91%), and Chyangra producers (48%). Around 60% of dairy and goat producing farmers used to adopt at least three CSATs in their farms. The number of farmers adopting CSATs under Call-I&II sub-projects, implemented individually, by number of CSATs in all three value chains have been presented in the following table. Such types of value chain wise use of CSATs in 2023 could not be compared with the baseline, as there were no value chain wise results on the CSATs in the baseline.

| level (mulvidual) by value chains in 2023 |                       |                                   |        |                       |                                |          |                                 |                                |                       |  |

### 3.3.3.2. Climate Smart Agriculture Technology (CSAT) Adoption in Call-I and II (Collective/PO level) sub-projects

The adoption of climate smart agricultural technologies (CSATs) in Call-I and II sub-projects, which were implemented collectively are presented and discussed in the following sub-sections.

# 3.3.3.2.1. Climate Smart Agriculture Technology Adoption in Targeted Livestock Commodities at Sub-project level (Collective/PO level) in 2023

Out of total 195 POs surveyed, who were implementing sub-projects collectively, 83% of them found to have adopted improved shed management practices, followed by manure management by 62%, whereas, 41% of them used fodders, forage production and pasture development, 25% adopted stall feeding as climate smart agricultural technologies (CSATs) in their livestock farms. The figures on the adoption of CSATs at the PO level (collective SPs) in 2023 have been presented in the following table. As there were no data/information on the types of CSATs in baseline, the endline results could not be compared with the baseline.

| CEAT  | Baseline (202   | 21) | Endline (2023)<br>(N=195 POs) |       |  |
|---|-----------------|-----|-------------------------------|-------|--|

| Saplings/seedlings production                         | NA              | -   | 11                            | 5.64  |  |
| Total   | 195             |     |                               |       |  |

Table 89: Climate Smart Agriculture Technology Adoption in Baseline (2021) and Endline(2023) in all Value Chains at Sub-project level (Collective/PO level)

#### 3.3.3.2.2. Comparison of Adoption of Climate Smart Agriculture Technology at Sub-project level (Call-I&II: Collective / PO level) between Baseline (2021) and Endline (2023) in All Value Chains

Out of the 195 POs surveyed, 100% of them were found to have used at least one climate smart agricultural technology (CSAT), which in 2021 there were 84% POs using at least one technology, which is about 19% more in 2023 as compared to baseline (2021). The figures on the adoption of CSATs at PO level and compared between baseline (2021) and endline (2023) have been presented in the following table.

#### 3.3.3.2.3. Comparison of Adoption of Climate Smart Agriculture Technology at Sub-project level (Call-I&II: Institutional / PO level) between Treatment and Control in all Value Chains in 2023

Of the total 195 treatement POs surveyed in 2023, 83% of them used to adopt improved shed management practices, as CSATs in their farms, followed by manure management (62%), and fodders, forage production and pasture development (41%), as compared to the control POs which adopted the same CSATs, were 84%, 38%, and 34% respectively. Except for improved shed management practices, the treatment POs used to adopt all other six CSATs more than that of control POs in 2023. The figures on the adoption of CSATs in both treatment and control POs in 2023, have been presented in the following table.

| CSAT  | Treatment Ca<br>(N=195 P |       | Control<br>(N=32 POs) |       | Treatment<br>over Control |  |
|---|--------------------------|-------|-----------------------|-------|---------------------------|--|

#### 3.3.3.2.4. Comparison of Adoption of Climate Smart Agriculture Technology at Sub-project level (Call-I&II: Collective / PO level) between Treatment and Control in All Value Chains 2023

While comparing between treatment and control POs adopting CSATs, both types of POs were found adopting at least one CSAT in their livestock farms. The treatment POs were found more effective in adopting more than two technologies in their farms than the control POs. The figures on the adoption of CSATs in treatment and control POs obtained in 2023, have been presented in the following table.

| Table 92: Comparison of Adoption of Climate Smart Agricult     | ture Technology at Sub-project          |

#### 3.3.3.3. Adoption of Climate Smart Agricultural Technologies (CSATs) at Private Farm Level under Call-III

The adoption of climate smart agricultural technologies (CSATs) in Call-III sub-projects, which were implemented by private farms are presented and discussed in the following sub-sections.

### 3.3.3.3.1. Climate Smart Agriculture Technology Adoption in all three targeted Livestock Commodities at Private Farm level in 2023

Out of total 254 private farms surveyed in 2023, maximum (94.5%) of private farms were found adopting improved shed management, followed by manure management (81%), stall feeding (42%), and fodders, forage production and pasture development (37%). About 85% women were found involved in the adoption of CSATs in the livestock farms.

| CSAT  | Baseli<br>(N=355 F |   | Total<br>(N=254 Farms) |       |
|---|--------------------|---|------------------------|-------|
| COAT  | Number of<br>Farms | % | Number of<br>Farms     | %     |
| Improved shed management                              | -                  | - | 240                    | 94.49 |
| Manure management                                     | -                  | - | 206                    | 81.10 |
| Fodders, Forage Production and Pasture<br>Development | -                  | - | 95                     | 37.40 |
| Hay and Silage making                                 | -                  | - | 46                     | 18.11 |
| Stall feeding   | -                  | - | 107                    | 42.13 |
| Forage seed production                                | -                  | - | 14                     | 5.51  |
| Saplings/seedlings production                         | -                  | - | 6                      | 2.36  |
| Total   | -                  | - | 254                    |       |
| Involvement of Women                                  |                    |   |                        | 84.6  |

Table 93: Climate Smart Agriculture Technology Adoption in Dairy, Goat Meat and ChyangraPashmina Value Chains at Sub-project level (Private Farm) in 2023

#### 3.3.3.3.2. Comparison of Number of Farmers adopting Climate Smart Agriculture Technology at Sub-project level (Private Farm level) during Baseline (2022) and Endline (2023)

In private farms, 92% of them who were adopting at least one CSAT in their livestock farms in 2022, increased to 100% in 2023, with increment of 9%. The 5.4% of private farms who were using two CSATs in 2022, increased to about 29% in 2023. However, per cent of private farms adopting at least two CSATs were more or less same (84%) in both baseline and endline. The adoption of CSATs compared between baseline (2022) and endline (2023) have been presented in the following table.

|                          |                                | seline (202<br>=355 Farm | · ·                                | Endline (2023)<br>(N=254 Farms) |                        |                                    | Increased %            |                                    |

#### 3.3.3.3.3. Comparison of Adoption of Climate Smart Agriculture Technology at Sub-project level (Call-III: Private Farm level) between Treatment and Control in All Value Chains in 2023

Out of the 254 treatment private farms, surveyed in 2023, maximum (94.5%) of private farms were found adopting improved shed management practices, for which in control privae farms it was 88%, which is 7% more effective than the control farms. Similarly, adoption of manure management was found as second important CSAT, both in treatment and control private farms, i.e. 81% in treatment and 69% in control private farms, which the treatment farms were about 18% more effective than that of control farms in using project's facilitated CSATs in the livestock farms. The results on the adoption of CSATs in treatment and control private farms, as obtained from survey held in 2023, have been presented in the following table.

| CSAT   | Call-III<br>Treatment (Private<br>Farm level)<br>(N=254 Farms) |       | Control (<br>Farm  <br>(N=147 | Treatment<br>over<br>Control |        |

### 3.3.3.3.4. Comparison of Adoption of Climate Smart Agriculture Technology at Sub-project level (Call-III: Private Farm level) between Treatment and Control in All Value Chains 2023

From the below table, it can be seen that 100 per cent of private farms both in treatment and control were found adopting at least one CSAT in their farms. However, 83% of treatment private farms were found using at least two CSATs, as against 70% in the control private farms. Similarly, treatment private farms were found more effective in using three and more CSATs in their farms as compared to the control private farms. The adoption of CSATs at sub-project level in the private farms compared between treatment and control, as obtained in 2023, have been presented in the following table.

|                          |                       | ent (N=254                    |                                 | Control (147 Farms)   |                               |                                 | % of Treatment<br>over Control |                                 |

 Table 96: Comparison of Adoption of Climate Smart Agriculture Technology at Sub-project

 level (Call-III: Private Farm level) between Treatment and Control in All Value Chains 2023

## 3.3.4. Share of Pproject Beneficiaries with a Livestock Risk Insurance Policy

In overall, about 98% of beneficiary individual households under Call-I&II subprojects, which were implemented individually, were found to have insured their livestock (cow, buffalo, goat and Chyangra) during endline survey (2023), which was nearly 27% in the baseline (2021).

Likewise, 75% of the beneficiary under collective sub-projects through Call-I&II, were found to have insured their livestock in 2023, as against 31% in the baseline (2021).

In case of private farms which were being implemented through the Call-III in 2022, 58% of them were ensuring their livestocks in the year 2022, increased to 84% after one year of implementation, i.e. in 2023.

An attempt has also been made to compare the insurance coverage, in terms of project's beneficiaries, between the treatment and control sub-projects. The treatment POs and private farms were found relatively better than their controls during the survey year-2023.

The share of project beneficiaries insuring their three targeted livestock commodities under Task-2 (Call-I&II, Call-III, and Controls) have been presented in the following table.

| Tuble 777 Institute explica in an value chains (Tuble 2) |   |   |  |   |        |  |  |

### **3.3.4.1.** Insurance applied in Dairy Value Chain (Task -2)

In dairy value chain under Task-2, there have been a significant increment in the beneficiaries insuring their dairy livestocks. Where there were only 30% households used to ensure their livestocks in 2021 under Call-I and II subprojects, implemented individually, increased to 97% in 2023. Similarly at the PO level, 30% of POs used to ensure livestock in 2021, increased to 59% in 2023. There is slightly increment, from 72% to 82%, in case of private farms, implemented under Call-III. Whereas, the control private farms and POs were found relatively better in insuring their livestocks. The figures on the insurance applied in dairy value chain under Task-2, have been presented in the following table.

| Table 98: Insurance applied in Dairy Value Chain (Task -2) |        |                       |                   |              |             |  |  |  |

### **3.3.4.2.** Insurance applied in Goat Value Chain (Task -2)

There has been a significant increment in the share of households and POs insuring their goat in 2023, as compared to their baseline. About 98% of the individual households under Task-2 sub-projects, implemented individually through the Call-II&II, were found to have insured their goats in 2023, as against 14% in the baseline (2021). Similarly, 92% of POs were found to have insured goat in their groups and cooperatives in 2023, as against 32% in 2021. In case of private farms, about 90% of farms have insured their goats in 2023, which was 49% in the year 2021. While comparing with the control sub-projects, the treatment POs and Private Farms were found better than that of the control POs and private farms. The figures obtained from the Task-2 and Institutional Survey, and compared with their baseline figures and also with the control sub-projects, have been presented in the following table.

| Insurance<br>Applied | Call I & Call II Call I & Call II Call III Sub-     |   | Call III Sub-                      | Sub-Projects (Contr  |                      |
|----------------------|---|---|------------------------------------|----------------------|----------------------|

#### 3.3.4.3. Insurance applied in Chyangra Pashmina Value Chain (Task -2)

In case of Chyangra Pashmina value chain, 100 % of individual farmers used to insure their Chyangra both in baseline and endline. However, the figures on the share of households and POs insuring their Chyangra in collective and private farms in baselines could not be found out. About 75% of POs were found to have insured Chyangra under Call-I and II, implemented collectively in 2023. Whereas, none of the private farms out of three, have been found ensuring their livestocks, as against 75% of control private farms used to insure their Chyangra in 2023. As there were no any POs under control in Chyangra Pashmina value chain, the treatment POs (75%) could not be compared. The figures on the insurance coverage in Chyangra Pashmina value chain, have been presented in the following table.

|           | Call I & Call II | Call I & Call II                         | Call III Sub-   | Sub-Projects | (Control) |  |
|-----------|------------------|--|-----------------|--------------|-----------|--|
| Incurance | Sub-Project      | Sub-Project                              | projects        | Driveta Form |           |  |
| Insurance | (Individual)     | (Collective / PO (Private Farm) (N. 4 in |                 | POs          |           |  |
| Applied   | (N=Baseline: 18; | level) (N=Baseline:                      | (N=Baseline: 3; | (N=4 in      | (N=0)     |  |
|           | Endline: 64)     | 2; Endline: 9)                           | Endline: 5)     | Endline)     |           |  |
| Baseline  | 100%             | NA                                       | NA              | -            | -         |  |
| Endline   | 100%             | 75%                                      | 0%              | 75%          | -         |  |

## 3.3.4.4. Number of livestocks insured and Compensation received in 2023 at sub-project levels under Task -2

It can be seen from below table that 72% of the livestocks in the sub-projects (POs and private farms) were insured in 2023, which was 68% in POs and 78% in private farms. Out of insured livestocks, around 11% of them were died, of which only 79% of them could receive compensation, which was

83% in POs, and 76% in private farms in 2023. The figures on the number of livestocks insured and compensation received during the year 2023 at sub-project levels, have been presented in the following table.

| <b>I</b> .                 |       | Subprojects  |       |  |  |  |  |
|----------------------------|-------|--------------|-------|--|--|--|--|
| Particulars                | POs   | Private Farm | Total |  |  |  |  |
| Total livestocks           | 28868 | 17265        | 46133 |  |  |  |  |
| No. of Insured livestocks  | 19559 | 13518        | 33077 |  |  |  |  |
| % of Insured livestocks    | 67.75 | 78.30        | 71.70 |  |  |  |  |
| No. of Dead livestocks     | 2446  | 1264         | 3710  |  |  |  |  |
| % of Dead livestocks       | 12.51 | 9.35         | 11.22 |  |  |  |  |
| % of Compensation received | 83.21 | 75.70        | 78.63 |  |  |  |  |

 Table 101: Number of Livestocks insured and compensation received in all value chains at subproject level in 2023 (Task -2)

Source: Endline Survey of NLSIP, 2023

Such lesser percentage of livestock insurance as observed in 2023, were due to under-valuation of exotic and pure breeds, delayed settlement of claims for compensation, no insurance provision for young livestocks, and there have been very compex administrative procedures for receiving compensations.

The endline survey also revealed that a total of 137 POs and 214 private firms have continued the livestock insurance. Of which 83% POs and 76% of Private Farms received the compensation of dead livestocks in 2023.

#### 3.3.4.5. Livestock Insurance Compensation received at Household level in 2023 under Task -2

An attempt has also been made to assess the rate of compensation received by households under Task-2 for dead and disabled productive livestocks during 2023, and the figures have been presented in the following table. It can be seen that only 54% of household who applied for compensation for their dead and disabled productive livestocks, could receive the compensation against their claims. Among the value chains, 58% of cow, 47% of buffalo and 60% of goat rearing farmers could receive the compensation for the dead livestocks against their claims.

|         | Total                           | 342                   | 183                    | 53.51                |  |  |  |  |  |

 Table 102: Compensation received on livestock Insurance in 2023 (Task -2: HH level)

## 3.3.5. Access in Production Assets and Services at Sub-project level (Task-2)

An attempt has been made to compare the Access in production assets and services at the sub-project level under Task-2, implemented at individual level, collectively and by private farms through the Call-I, II and III respectively between baseline and endline. It has also been tried to comapre the accessibilities between treatment and control POs and private farms. The results obtained from the endline survey and compared with their baseliines, and controls, have been presented and discussed in the following sections.

### 3.3.5.1. Comparison of Access in Production Assets and Services at Sub-project level between Baseline (2021) and Endline (2023) (Call-I and II: Individual)

Comparison of access in production assets and services at sub-project level implemented individually, under Call-I and II, between baseline and endline for all value chains, and results of obtained from endline survey (2023) for each value chain are presented and discussed in the sections below.

# 3.3.5.1.1. Comparison of Increased Access in Production Assets and Services at Sub-project level (Call-I and II: Individual) from Baseline (2021) to Endline (2023)) for All Value Chains

It can be seen in the table below that among the assets, maximum (85%) of Task-2 households could receive the livestock sheds, followed by chaff-cutters (68%), live livestocks (64%), milk can by 45%, as of 2023. Among the services, additional 34% of households received vaccination services in 2023, reaching 94% as of 2023. Similarly, AI and livestock treatment services reached to 75% and 61% of households as of 2023 with. The results on the access in production assets and services at sub-project level under Call-I and II recorded in baseline, additional figures as obtained in endline and cumulative percentage of households having access, have been presented in the following table.

| Production Assets and<br>Services | Baseline (<br>HH | N=2032<br>s) | Additiona<br>Endline (<br>HH | l HHs in<br>N=1053<br>s) | Total % of HHs<br>having Access to |
|-----------------------------------|------------------|--------------|------------------------------|--------------------------|------------------------------------|
|                                   | Count            | %            | Count                        | %                        |                                    |

## 3.3.5.1.2. Access in Production Assets and Services at Sub-project level (Call-I&II: Individual HH level) in all three Value Chains in 2023

Comparing among the three value chains, all the Chyangra rearing individual households received sheds, followed by solar panels received by 98% of Chyangra rearing households, then milk can receive by dairy farmers (92%), and 90% of Chyangra rearing households received vaccination and parasite control services from the project-NLSIP. These figures on the access in production assets and services in all three targeted livestock commodities in 2023, have been presented in the following table.

|                              | HH level) in all three Value Chains in 2023 |        |          |                |              |         |          |        |  |  |

 Table 104: Access in Production Assets and Services at Sub-project level (Call-I&II: Individual HH level) in all three Value Chains in 2023

Source: Endline Survey of NLSIP, 2023

## **3.3.5.2.** Comparison of Access in Production Assets and Services at Sub-project level (Call-I and II: Collective / PO levels)

In this section, access in production assets and services at the sub-project (PO) level, implemented collectively under Call-I and II, compared between baseline (2021) and endline (2023), and also with control sub-projects, are presented and discussed.

# 3.3.5.2.1. Increased Access in Production Assets and Services at Sub-project level (Call-I and II: PO levels) from Baseline (2021) to Endline (2023) for All Value Chains

Out of total 195 POs surveyed under Call-I and II, 51% of them reported that they have received milk cans, 58% chaff-cutters, 58% sheds, 47% live livestocks, and 42% received weighing balance as production assets in 2023, and these figures are significantly higher than that of the baseline (2021). But, in case of services, some endline values are seen lesser than the baseline values, such as in vaccination, and parasitic controls, and none of them reported to have received the AI services in 2023.

This may be due to the closure of the NLSIP program in 2023. The comparison between the access in production assets and services at the PO level between baseline (2021) and endline (2023), have been presented in the following table.

| Table 105: Comparison of Increased Ac    | cess in Production Asse | ts and Services at Sub-project |

#### 3.3.5.2.2. Comparison in Access in Production Assets and Services at Sub-project level (Call-I&II: Collective) in All Value Chains between Treatment and Control in 2023

While comparing between treatment and control POs under Call-I and II sub-projects, the treatment POs were found to have more access to production assets and services, as compared to the control POs, as per results of the institutional survey conducted in 2023, and such figures as obtained for treatment and control POs, have been presented in the following table.

| Production Assets and Services         Treatment (2023)<br>(N=195 POs)         Control (2023)<br>(N=32 POs)           (c)         Assets         Count         %         Count         %           (c)         Assets         100         51.28         8         25.00           Cream Separator         27         13.85         1         3.13           Milking Machine         13         6.67         0         0.00           Pasteuraizer         29         14.87         2         6.25           Chaff cutter         113         57.95         4         12.50           Weighing balance         81         41.54         3         9.38           Solar panel         14         7.18         -         -           Silage making machine         5         2.56         -         -           Wheel barrow         42         21.54         3         9.38           Fork         -         -         -         -           Live livestocks         91         46.67         2         6.25           Building         20         10.26         1         3.13           Sheds         113         57.95         5         15.63 <t< th=""><th></th><th></th><th colspan="9">(Call-I&amp;II: Collective) in All Value Chains between Treatment and Control in 2023</th></t<> |                                |                                       | (Call-I&II: Collective) in All Value Chains between Treatment and Control in 2023 |                                       |       |  |  |  |  |  |  |

## 3.3.5.3. Access in Production Assets and Services at Sub-project level under Call-III (Private Farm levels)

An attempt has also been made to assess the access in production assets and services at sub-project level under Call-III, which were implemented by private farms, the results as obtained from the institutional survey conducted in 2023, have been presented and discussed as under.

## 3.3.5.3.1. Comparison on Increased Access in Production Assets and Services at Sub-project level (Call-III: Private Farm levels) from Baseline (2021) to Endline (2023) for All Value Chains

As there were no baseline information regarding the access in production assets and services at the private farm level, the following table highlights only the endline results on the access in production assets and services at the private farm level, implemented in 2022 under Call-III. Among the assets, about 54% of private farms received milk can, followed by sheds (38%), chaff-cutter (33%), weighing balance (31%), and live livestocks by 25% farms. There are very less number of farms (less than 15%) who reported to have received services from the project. This may be due to the closure of the project

in 2023, and they might not have received the project's services. The figures on the access of production assets and services at the private farm level, under Call-III in 2023, have been presented in the following table.

## Table 107: Comparison on Increased Access in Production Assets and Services at Sub-project level (Call-III: Private Farm levels) from Baseline (2021) to Endline (2023) for All Value Chains

#### 3.3.5.3.2. Comparison of Access in Production Assets and Services at Sub-project level (Call-III: Private Farms) in All Value Chains between Treatment and Control in 2023

It has been found that, though there were very less access to production assets and services at the treatment private farm level in 2023, these figures are significantly higher than that of the control private farms, which can be seen in the following table.

| Production Assets and Services | Treatr<br>(N= 254 ] | nent  | Control<br>(N=147 Farms) |      |  |
|--------------------------------|---------------------|-------|--------------------------|------|--|

 Table 108: Comparison of Access in Production Assets and Services at Sub-project level (Call-III: Private Farms) in All Value Chains between Treatment and Control in 2023

## 3.3.6. Beneficiary Satisfaction Rate with Relevance, Timeliness and Effectiveness of Services Provided by the Project for the Livestock Sector (Task-2)

#### 3.3.6.1. Beneficiaries' Satisfaction at Sub-project level (Call-I and II: Individual HH level)

Among 1053 beneficiary individual households surveyed under Task-2 Call-I andII implemented individually, 92% of them reported that they are satisfied with project's supports in terms of timeliness, relevancy and effectiveness, as against the baseline value of 66%. Of them majority of households (38.5%) were highly satisfied, 27% each satisfied and moderately satisfied in 2023. There were 89.5% of women in overall satisfied with the project's services provided by the NLSIP, of which 34.4% were highly satisfied in 2023. However, very less (3%) were unsatisfied in overall in 2023, which in the baseline was 0.72%. The responses of the individual households under Call-I and II sub-projects on the satisfaction levels as obtained from the survey, and compared with the baseline value, have been presented in the following table.

|                 | Number of | Numbe     | Number of HHs Rated Satisfaction on Project's Services |            |             |             |  |
|-----------------|-----------|-----------|--|------------|-------------|-------------|--|
|                 | Surveyed  | Highly    | Satisfied  | Moderately | Moderately  | Unsatisfied |  |
|                 | HHs       | Satisfied |  | Satisfied  | Unsatisfied |             |  |

#### Table 109: Beneficiaries' Satisfaction at Sub-project level (Call-I&II-Individual HH level)

Source: Endline Survey of NLSIP, 2023

#### **3.3.6.2.** Beneficiaries' Satisfaction at Sub-project level (Call-I and II-PO level)

Of the total 195 POs surveyed, 89% of the POs reported that they are satisfied by the project's services, which in 2021, 75% of the POs, were satisfied, based on the survey of 137 POs. Out of the 89% level of satisfaction in 2023, 32% were highly satisfied, 25% satisfied and 32% were moderately satisfied in terms of timeliness, relevancy and effectiveness of the project's services. However, 4% of them were moderately unsatisfied and about 7% were unsatisfied from the project's services in 2023. The percentage of unsatisfied were high (7.25%) in 2023 as compared to baseline (0.73%). The results of the responses received from the POs under Call-I and II subprojects in 2023, and compared with the baseline values, regarding the satisfaction levels from the project's services, have been presented in the following table.

|                 | Number of    | Number of HHs Rated Satisfaction on Project's Services |           |                         |                           |             |  |

 Table 110: Beneficiaries' Satisfaction at Sub-project level (Call-I and II-PO level)

Source: Endline Survey of NLSIP, 2023

#### **3.3.6.3.** Beneficiaries' Satisfaction at Sub-project level (Call-III-Private Farm level)

In case of private farms, out of 254 farms 87% of them reported that they were satisfied by the project's services, of which 36% were highly satisfied, 23% satisfied, and 28% moderately satisfied in 2023. However, 5% were moderately unsatisfied, and 8% were unsatisfied from the project's services in 2023. These figures on satisfaction, as obtained in 2023 could not be compared with the baseline, as there were no figures on satisfaction in baseline (2021). The figures on the satisfaction levels as obtained in 2023 for private farms, have been presented in the following table.

|                    | Number                  | Numb                | Number of HHs Rated Satisfaction on Project's Services |                         |                           |             |         |  |

Table 111: Beneficiaries' Satisfaction at Sub-project level (Call-III-Private Farm level)

# 3.3.7. Cost and Profitability Analysis of Targeted Livestock Commodities at Sub-project Level (Task-2)

The cost of production of targeted livestock commodities at sub-project levels, particularly of milk and goat meat, as estimated based on the endline survey results of Task-2 households, POs and Private Farms, which were implemented under Call-I, II and III of the project-NLSIP, and their profitability are discussed in the successive sections below.

#### 3.3.7.1. Cost of Production of Milk and Goat Meat at the Sub-Project level (Task-2) in 2023

The cost of production per liter of milk at individual household, PO and Private farm level under Task-2 in 2023 was estimated to be Rs. 32.83, Rs. 44.83, and Rs. 80.56 respectively. Whereas, the cost of production per liter of milk at control POs and Private farm levels were Rs. 59.68 and 48.51 respectively. Profit per liter of milk in individual household, PO and Private farm level under Task-2 in 2023 were estimated to be Rs. 34.17, Rs. 9.74, and Rs. 2.02 respectively. Where as in control POs and Private farms, the profit per liter were estimated to be Rs. 16.79 and Rs. 18.28 respectively. These cost of production and profit per liter of milk could not be compared with the baseline as there were no information on these parameters.

Similarly, the cost of production per Kg of goat meat (on live weight basis) in individual household, PO and Private farm level under Task-2 in 2023 was estimated to be Rs. 216.17, Rs. 157.65 and Rs. 258.78 respectively. Whereas, the cost of production at control POs and Private farm levels were Rs. 434.75 and 245.99 respectively. Profit per Kg of goat meat (on live weight basis) in individual household, PO and Private farm level under Task-2 in 2023 were estimated to be Rs. 331.92, Rs. 377.47, and Rs. 363.10 respectively. Where as in control POs and Private farms, the profit per kg of goat meat (on live weight basis) were estimated to be Rs. 88.59 and Rs. 422.66 respectively. These cost of production and profit per Kg of goat meat could not be compared with the baseline as there were no information on these parameters,

The figures on the cost of production per unit and profit per unit of milk and goat meat in individual household, PO and Private farm level, and compared with the control PO and Private farm level have been presented in the following table.

|                |   |                | Individual                                 | PO level Farm level PO level Private |  | ontrol                                   |  |

Table 112: Cost of Production, Price and Profit per Unit of Milk and Goat Meat at Sub-Project level (Task-2) in 2023

#### 3.3.7.2. Profitability Analysis of Dairy Enterprises in Task-2 (Sub-Project level) in 2023

The dairy business implemented by the individual households under Call-I and II, were found efficient in profit making than the PO level, which is observed as moderate. Whereas, the Private dairy farms implemented under Call-III, were found in-efficient in profit making, which is due to the larger investment on building, machinery and equipment incurring more fixed costs, and equally incurring more cost on the feed, fodder and other working capitals, causing high cost of production and less profit margin. As these farms are in the first year of implementation, principally the cost will be higher than the return. On the other hand, the control POs and private farms were found moderately efficient in profit making as they did not invest more capital in their businesses and run as usual. The Return on Asset (RoA), Net-Profit Margin, and Return on Labour of the Dairy enterprises analyzed at sub-project level in 2023, have been presented in the following table.

|  |       | Individual          |                     | Private               | Control            |                                 |  |
|--|-------|---------------------|---------------------|-----------------------|--------------------|---------------------------------|--|
| Indicators                             | Units | HH level<br>(N=503) | PO level<br>(N=117) | Farm level<br>(N=152) | PO level<br>(N=18) | Private<br>Farm level<br>(N=99) |  |
| Return on Asset<br>(ROA) <sup>18</sup> | %     | 73.99               | 7.85                | 2.05                  | 21.01              | 19.63                           |  |
| Net Profit<br>Margin <sup>19</sup>     | %     | 51.00               | 17.26               | 2.45                  | 21.95              | 27.37                           |  |
| Return on<br>Labour <sup>20</sup>      | %     | 57.85               | 20.19               | 4.28                  | 22.70              | 29.71                           |  |

#### 3.3.7.3. Profitability Analysis of Goat Enterprises in Task-2 (Sub-Project level) in 2023

In goat enterprises, run by individual households, POs and private farms, were found highly efficient in profit making. This is because of lesser investment in fixed capital and very less expenditure on concentrate feed for goat. The control private farms were also observed as equally profitable, whereas, the control POs were found relatively lesser efficient than other types of sub-projects. The Return on Asset (RoA), Net-Profit Margin, and Return on Labour of the Goat enterprises analyzed at sub-project level in 2023, have been presented in the following table.

|                          |       | Individual          | PO level | Private               | Control            |                                 |  |
|--------------------------|-------|---------------------|----------|-----------------------|--------------------|---------------------------------|--|
| Indicators               | Units | HH level<br>(N=486) | (N=65)   | Farm level<br>(N=101) | PO level<br>(N=14) | Private<br>Farm level<br>(N=42) |  |

## 3.3.8. Employment Generation at Sub-Project Level

The livestock enterprises in Nepal are labour-intensive in nature, give opportunity for self-employment for livestock owner, and employment for hired labours. In this section, an attempt has been made to analyse the employment generated at sub-project level implemented through Call-I, II and III of the NLSIP Project.

# 3.3.8.1. Employment Generation at Sub-Project (Call-I &II: Individual HH level) level in All Value Chains

It can be seen in the following table that the livestock enterprises implemented through the Call-I and II, could generate 3.96 person years of employment per household, including both family and hired labour, which was 2.4 person years during the baseline year (2021). Out of total labour force employed by livestock enterprise, 2.36 person years for family, and 1.59 person years for hired labour were employed. The result of employment also showed that women drudgery in livetock business has been reduced, i.e. from 52.36% in 2021 to 46.17% in 2023. The results of the employment generation in livestock enterprises implemented individually under Call-I and II obtained in 2023 and compared with the baseline (2021), have been presented in the following table.

| Employ<br>ment         |      | -          | Baseline | , 2021         |                             |      |        | Endline | 2023           |                             |

| Overall                | 2320 | 2550       | 4870     | 52.36          | 2.4                         | 2243 | 1924   | 4167    | 46.17          | 3.96                        |
| Total<br>HHs           | 1.   |            | 203      | 2              | CALLEID 200                 | 1053 |        |         |                |                             |

| Table 115: Employment Generation at Sub-Project (Call-I &II: Individual HH lvel) level in All |
|---|
| Value Chains  |

Source: Baseline, 2021, and Endline Survey of NLSIP, 2023

As per the minimum wage rate of Rs. 17,300 per month as fixed by the GoN, a livestock enterprise run by individual household can provide Rs. 822,096 of employment from a livestock enterprise, of which Rs. 489,936 is retained within the family as family labour and rest Rs. 332,160 is going for hired labour.

### 3.3.8.2. Employment Generation at Sub-Project (Call-I &II: PO level) level in All Value Chains

It can be seen in the following table that the livestock enterprises implemented through the Call-I and II, implemented by PO, could generate 13.91 person years of employment per PO, including both family and hired labour, which was 14.4 person years per PO during the baseline year (2021). Out of total

labour force employed by livestock enterprise, 2.36 person years for family, and 1.59 person years for hired labour were employed. Family labour in PO decreased from 9.1 to 7.02 person years from 2021 to 2023, and increased hired labour, i.e. from 1.3 to 6.89 during the respective years. This shows that although the overall labour employment decreased in endline, the PO shfted the family labour to hired labour, giving more employment opportunities to the hired labours. The result of employment also showed that women drudgery in livetock business has been reduced in case of family labour, i.e. from 50% in 2021 to 47.33% in 2023, increasing women hired labour, i.e. from 44% to 51%. The results of the employment generation in livestock enterprises implemented by PO, under Call-I and II, obtained in 2023 and compared with the baseline (2021), have been presented in the following table.

|                     |      |        |             |                | Chains                          |              |        |           |                    |                              |  |
|---------------------|------|--------|-------------|----------------|---------------------------------|--------------|--------|-----------|--------------------|------------------------------|--|
|                     |      | B      | Baseline, 1 | 2021           |                                 | Endline 2023 |        |           |                    |                              |  |
| Employme<br>nt      | Male | Female | Total       | % of<br>Female | Employ<br>ee per<br>PO<br>(No.) | Male         | Female | Tota<br>1 | % of<br>Femal<br>e | Employe<br>e Per PO<br>(No.) |  |
| Full time<br>family | 771  | 1027   | 2054        | 50             | 9.1                             | 721          | 648    | 136<br>9  | 47.33              | 7.02                         |  |
| Part time<br>family | 328  | 188    | 516         | 36.4           | 2.3                             | -            | -      | -         | -                  | -                            |  |
| Full time<br>Hired  | 255  | 142    | 397         | 35.7           | 1.8                             | -            | -      | -         | -                  | -                            |  |
| Part time<br>Hired  | 253  | 126    | 288         | 43.8           | 1.3                             | 664          | 680    | 134<br>4  | 50.60              | 6.89                         |  |
| Overall             | 1607 | 1483   | 3255        | 45.56          | 14.4                            | 1385         | 1328   | 271       | 48.95              | 13.91                        |  |
| Total POs           |      |        | 226         |                |                                 | 195          |        |           |                    |                              |  |

 Table 116: Employment Generation at Sub-Project (Call-I &II: PO Level) level in All Value

Source: Baseline, 2021, and Endline Survey of NLSIP, 2023

At the PO level, Rs. 2,887,716 of employment is generated per PO, as recorded in 2023, of which Rs. 1,430,364 goes for hired labour.

#### 3.3.8.3. Employment Generation at Sub-Project (Call-III: Private Farm level) level in All Value Chains

It can be seen in the following table that the livestock enterprises implemented through the Call-III, implemented by Private Farms, could generate 4.92 person years of employment per Private Farm, including both family and hired labour, which was 5.06 person years per Private Farm during the baseline year (2021). Due to introduction of innovations and climate smart technologies in the farms, the human labour per farm, might have been reduced. Out of total labour force employed by private livestock farms, 2.18 persons for family, and 2.74 person for part-time hired labour in 2023 have been observed. Family labour in Private Farms decreased from 2.77 to 2.18 person from 2022 to 2023, and increased hired labour, i.e. from 2.29 to 2.74 during the respective years. This shows that although the overall labour employment decreased in endline, the Private Farms shfted the family labour to hired labour, giving more employment opportunities to the hired labours. The result of employment also showed that women drudgery in livetock business has been reduced, i.e. from 46% in 2022 to 42.5% in 2023. The results of the employment generation in livestock enterprises implemented by Private Farms, under Call-III, obtained in 2023 and compared with the baseline (2022), have been presented in the following table.

|                           |      |            |           |                    | Chains                        |        |            |             |                    |                                   |

 Table 117: Employment Generation at Sub-Project (Call-III: Private Farm Level) level in All Value

Source: Baseline, 2021, and Endline Survey of NLSIP, 2023

At the Private Farm level, Rs. 1,021,392 of employment is generated per Private Farm, as recorded in 2023, of which Rs. 568,824 goes for hired labour.

## 3.3.8.4. Comparison of Employment Generation between Treatment Sub-Projects (Call-I &II: PO level) and Control POs in All Value Chains

The employment generation among the control POs were observed much lesser (4.97) as compared to the treatment POs (13.9) in the year 2023. However, proportion of female employment is lesser in treatment POs (49%) as compared to the control POs (53.5%), showing lesser drudgery on women in treatment POs as compared to the control ones. The results of the employment generation in livestock enterprises implemented by PO, under Call-I and II, and compared with their control POs, so obtained in 2023, have been presented in the following table.

|                     |      | (      | Control | 2023           |                              | Treatment, 2023 |        |       |                |                             |  |
|---------------------|------|--------|---------|----------------|------------------------------|-----------------|--------|-------|----------------|-----------------------------|--|

 Table 118: Employment Generation at Sub-Project (Call-I &II) Treatment and Control PO level in

 All Value Chains

Source: Endline Survey of NLSIP, 2023

Comparing labour employment in terms of wage earned between treatment and control POs, the treatment POs are giving Rs. 1,855,944 of more employment than the control POs as recorded in 2023.

#### 3.3.8.5. Comparison of Employment Generation between Treatment Sub-Projects (Call-III: Private Farm level) and Control Private Farms in All Value Chains

The employment generation from livestock enterprises implemented through the Call-III, implemented by Private Farms, could generate 4.92 person years of employment per Private Farm, whereas in the control private farms, only 3.56 person years of employment could be generated in the year 2023, showing the treatment private farms are giving more employment opportunities than the control private farms. The treatment private farms were found giving more employment opportunities for both family and hired labours. The proportion of women employment were seen more or less similar in both treatment (42.5%) and control private farms (43.3%) in 2023. The results of the employment generation in livestock enterprises implemented by Private Farms, under Call-III, and compared with their control private farms in the year 2023, have been presented in the following table.

|                        | Priva  | le rarm | Level) al | na Contr       | ol Private F                  | arms in | All valu | e Chains  |                |                               |

 Table 119: Comparison of Employment Generation between Treatment Sub-Projects (Call-III:

 Private Farm Level) and Control Private Farms in All Value Chains

Source: Endline Survey of NLSIP, 2023

Comparing labour employment in terms of wage earned between treatment and control Private Farms, the treatment Private Farms are giving Rs. 282,336 of more employment than the control Private Farms as recorded in 2023.

# 3.3.9. Productive Alliance and Value Chain Linkages between Beneficiary HH/POs and Processer/Trader (Task-2)

There was 100 % individual farmers, POs and private farms, who had written agreement with the buyers, as per the mandatory provision of the productive alliances had to be done for sub-project implementation under Task-2, which were very low in case of control POs and control Private farms. However, verbal agreement could also be seen in the sub-projects, i.e. from 51 to 84% of farmers, POs and private linked with the traders on verbal agreement both in treatment and control groups. The individual farmers do not make agreement with traders but generally such agreements were done by the POs for all the farmers associated with their POs. The figures on the productive alliances made and value chain linkages established between producer farmers, POs, and private farms with the traders/buyers and compared with the control POs and private farms, for all value chains collectively, have been presented in the following table.

| Table 120: Productive Alliances and Value Chain Linkages established between Treatment Sub- |

#### 3.3.9.1. Productive Alliances and Value Chain Linkages established between Treatment Sub-Projects and their Controls in Dairy Value Chain in 2023

It can be seen from below table that 100% of written agreement between sellers and buyers in dairy value chain were used to be done for all types of treatment sub-projects in 2023, as against 25% for individual POs, 21% in private farms, and no formal agreement from collective POs at control institutions. In case of dairy farmers, the individual dairy farmers do not make agreement with traders but generally such agreements were done by the POs for all the dairy farmers associated with their POs. Majority of individual households, and treatment POs were found selling their products to NLSIP supported buyers. Those agreement made between sellers and buyers, most of them were found complied, except in individual household level in 2023. The productive alliances and value chain linkages established in 2023 between treatment sub-projects and their control in dairy value chain have been presented in the following table.

| Projects and their Controls in Dairy Value Chain in 2023 |                                      |                                      |                                      |                               |                                      |                                      |                 |  |  |

#### 3.3.9.2. Productive Alliances and Value Chain Linkages established between Treatment Sub-Projects and their Controls in Goat Value Chain in 2023

Its case of goat value chain also 100% of sub-projects (all institutions including individual households) were found having written agreement with the buyers, as observed in 2023. Whereas, only 12% of control private farms were able to make written agreement with buyers in the same year. In case of goat also, the individual goat rearing farmers do not make agreement with traders but generally such agreements were done by the POs for all the goat rearing farmers associated with their POs.Out of the total sellers, most of them used to sell to other organization supported buyers both in treatment and control sub-projects. Those agreement made between sellers and buyers in goat value chain most of them, both in treatment and control sub-projects, were found complied. The productive alliances and value chain linkages established in 2023 between treatment sub-projects and their control in goat value chain have been presented in the following table.

| Projects and their Controls in Goat Value Chain in 2023 |   |                |                                      |                                      |                 |   |      |  |

Projects and their Controls in Goat Value Chain in 2023

## 3.3.10. Income Earned at Sub-Project Level (Task-2)

An attempt has been made in this section to demonstrate the income earned by the individual households under Call-I&II, and institution level income earned (PO and Private Farms) under Call-I&II and III, respectively, and have been presented and discussed in the following sub-sections.

#### 3.3.10.1. Household Income at Sub-Project level (Task-2)

It can be seen from the below table that, the individual households under Call-I&II, were able to earn Rs. 866 thousand in a year, on an average, of which máximum of earning used to come from sale of three major livestock commodities (Rs. 354 thousands, i.e. 41% of the total income) from their livestock farms. The second most contributing source was reported to be the grant received from government and non-government institutions, which accounted for 14%. Sale of FYM and other agricultural commodies collectively contributed to 20% of the total household income under the Task-2 (Call-I&II), implemented individually. The income earned from different sources by individual households under Call-I&II sub-projects have been presented in the following table.

| S. N. | Sources of Income                      | Income per household<br>(Rs.) | % of Total |
|-------|--|-------------------------------|------------|
| 1     | Sale of three value chain commodities  | (N=1053)<br>353,843.84        | 40.84      |
| 2     |  | ,                             |            |
|       | Sale of by-products (farm yard manure) | 14,494.46                     | 1.67       |
| 3     | Sale of other livestock                | 62,912.89                     | 7.26       |
| 4     | Sale of oil seed crops/products        | 5,174.57                      | 0.60       |
| 5     | Sale of cereal crops/products          | 33,658.84                     | 3.89       |
| 6     | Sale of vegetables                     | 60,159.61                     | 6.94       |

| 18    | Other Income                           | 29,793.56                     | 3.44       |
|       | Total household income                 | 866,315.69                    | 100.00     |

#### Table 123: Individual Household Income at Sub-project level (Task-2)

Source: Endline Survey of NLSIP, 2023

### 3.3.10.2. Income Earned at Institutional Level (Task-2)

The average income per year per PO (individual), PO (collective) and private farm in 2023 were estimated to be Rs. 9.4 million, Rs. 14.09 million, and Rs. 10.1 million respectively. These income levels at the treatment institutions were found significantly higher than that of the control institutions, i.e. Rs. 3.3 million, Rs. 3.99 million, and Rs. 3.97 million in individual PO, collective PO, and private farms respectively. The income from sale of three major livestock commodities out of the total both in treatment and control institutions were more than 90%. However, the income earned from three major livestock commodities by treatment institutions were significantly higher than that of the control

institutions. These figures on the income earned by the treatment and control institutions recorded in 2023, have been presented in the following table.

|   | Endline T                           | reatment (202                       | Endline Control (2023) (N=179) |                       |                       |                       |  |

## 3.3.11. Investment Modality at Sub-Project Level

In overall, 39 per cent of the treatment institutions were able to receive loan, followed by grant (35%), and 26% of them invested from their equity. Whereas the control POs and private farms used to use more equity i.e. 88% and 51% respectively. About 49% of control private farms used to take loan for their business. The grant portion at the control POs and private farms were zero or negligible. The investment modality as observed in the treatement and control institutions in 2023, have been presented in the following table.

| Table 125. Investment would be sub-project level (Task-2) |                               |                               |                                   |         |      |              |  |  |

## 3.3.12. Management of animal's feeds at Sub-Project Levels (Task-2)

Maximum of individual dairy farmers under Call-I&II used to use green forage (83%), concentrate feed (78%), and dry forage (74%). Goat rearing farmers were also found using more green forage (86%), followed by concentrate feed (81%), and dry forage (48%). Almost all Chyangra rearing farmers used to use gree forage and dry forage, followed by concentrate feed and hay/silage (27%) under the Call-I&II sub-projects, implemented individually. The figures on the use of animal feed by the individual farmers under Call-I&II, under Task-2, have been presented in the following table.

| Types of Feed      | Dariy | Dariy (N=503) |     | (N=486) | Chyangra Pashmina<br>(N=64) |        |  |

## 3.3.13. Innovation Applied for Scaling up of Agro-enterprises at Sub-project level (Task-2)

The NLSIP has supported to the producers' farmers and agro-enterprises through the sub-projects for scaling up of their agribusinesses by promoting the use of new technologies and innovations. The frequency of innovation applied in the agro/livesock farms (sub-project level) have been presented in the following table. It can be seen from the below table that, 4-18% of dairy enterprises in the treatment institutions, used milking machines, which were none or very less in the control institutions. The second innovation was the milking parlour in the dairy farms, which very less number of farms used both in treatment and control farms. Urine collection in the farms were significantly high in the livestock farms i.e. 37-59% in treatment farms and 14 to 50% in control farms. Cow mats were also found commonly

used innovation in the dairy farms. The types of innovation used by different institutions and compared with the control institutions have been presented in the following table.

| Table 127: Innovation applied at Sub-project level (Task-2) |                                      |                                      |                                      |                                |                                      |                                      |                  |  |

### 3.3.14. Compliance to environmental and social safeguards measures

The individual households, POs and private farms implemented under Call-I&II, and Call-III, used to use various environmental and social safeguard measures in their livestock farms. The following table highlights about various environmental and social safeguards measures applied in the sub-projects implemented under Call-I&II and Call-III. It can be seen from the following table that individual households and private farms under treatment institutions were found applying most environmental and social safeguard measures. On the control POs in applying such safeguard measures. On the contray, the control private farms were found applying more environmental and social safeguard measures than the treatment private farms. The figures on the environmental and social safeguard measures, which were applied in the livestock farms at the sub-project level in 2023, and compared with the control farms, have been presented in the following table.

| Measures in all Value Chains in 2023                       |                   |                                 |                                 |                                  |                          |                          |                        |  |  |

#### 3.3.15. Access in market price of three value chain commodities under Task-2

As in the Task-1 households, most of the Task-2 households were found receiving market price information from their groups and cooperatives. It can be seen from the below table that 77% of the households under Task-2 (Call-I&II), used to receive market price information from their groups and cooperatives, which in dairy 77%, goat 74%, and highest was in Chyangra rearing farmers (95%). The second source of market information for individual livestock rearing farms was from the Buyers/Traders. The various sources of market price information for individual farmers under Task-2, recorded in 2023, have been presented in the following table.

| Sources of<br>Market | Dairy (         | Dairy (N=503) Goat (N=486) |                 | Chya<br>Pashmina |                 | Total (N=1053) |                 |            |

 Table 129: Access in Market Price Information under Task-2 in 2023

## 3.3.16. Beneficiaries' Satisfaction on PO's Services:

The Producers' Organizations (POs) used to provide various services to their member farmers, and the responses of the member farmers on their satisfaction levels towards the PO's services, have been presented in the following table. It can be seen from the below table that most of the member farmers were found most satisfied from the technical training, business training and nursery management services provided by their POs. In case of marketing services rendered by the POs to their beneficiary members, 77% of dairy farmers and 74.5% of goat rearing farmers were satisfied with the marketing services in receiving market price information from their POs. The figures of the farmers' responses on their satisfaction levels towards the services provided by their POs, as obtained in 2023, have been presented in the following table.

| Services provided by     | Satisfaction Level as reported | % of Households (Task-2) Reporting  |                   |  |  |
|--------------------------|--------------------------------|---|-------------------|--|--|
| POs                      | by the Beneficiaries           | Dairy (N=503)   | Goat Meat (N=486) |  |  |
|                          | High                           | 74.4  | 89.1              |  |  |

 Table 130: Beneficiaries' Satisfaction Levels on PO's Services under Task-2 in 2023

Source: Endline Survey of NLSIP, 2023

### 3.3.17. Beneficiaries' Satisfaction on Project's Services at Sub-Project Levels:

An attempt has been made to demonstrate the satisfaction levels of the beneficiaries as responed during the endline survey conducted in 2023, have been presented and discussed in the following sub-sections.

### 3.3.17.1. Beneficiaries' Satisfaction on Project's Services at Individual Households under Call-I&II

About 92% of the beneficiary individual households under Call-I&II subprojects (Task-2) were found satisfied from the project (NLSIP)'s services as reported in the year 2023, in terms of timeliness, relevancy and effectiveness of the project's services. However, 4.5% of the beneficiaries were moderately unsatisfied and 3.2% of them were unsatisfied. The figures on the level of satisfactions as rated by the individual sample households of sub-projects under Call-I&II, implemented individually in 2021, have been presented in the following table.

| Aspects/degree of satisfactions (N=1053) | Highly Satisfied | Moderately<br>Satisfied | Satisfied | Moderately<br>Unsatisfied | Unsatisfied |
|--|------------------|-------------------------|-----------|---------------------------|-------------|
| Timeliness                               | 43.9             | 25.7                    | 23.4      | 4.2                       | 2.8         |
| Relevancy                                | 34.7             | 29.4                    | 28.6      | 4.6                       | 2.8         |
| Effectiveness                            | 36.9             | 25                      | 29.2      | 4.7                       | 4.1         |
| Average                                  | 38.5             | 26.7                    | 27.1      | 4.5                       | 3.2         |
| <b>Overall Satisfied</b>                 |                  | 92.3%                   |           |                           |             |

## Table 131: Beneficiaries' Satisfaction Levels on Project's Services under Task-2 (Individual HH level) in 2023

Source: Endline Survey of NLSIP, 2023

## 3.3.17.2. Beneficiaries' Satisfaction on Project's Services at Subroject level under Call-I&II (PO level)

About 89% of the beneficiary POs under Call-I&II subprojects (Task-2), which were implemented in 2021, were found satisfied from the project (NLSIP)'s services as reported in the year 2023, in terms of timeliness, relevancy and effectiveness of the project's services. However, 4.0% of the beneficiary POs were moderately unsatisfied and 7.2% of the POs were unsatisfied. The figures on the level of satisfactions as rated by the sample POs of the sub-projects implemented under Call-I&II in 2021, have been presented in the following table.

## Table 132: Beneficiaries' Satisfaction Levels on Project's Services under Task-2 (Call-I&II: PO level) in 2023

| Aspects/degree of satisfactions (N=191) | Highly Satisfied | Moderately<br>Satisfied | Satisfied | Moderately<br>Unsatisfied | Unsatisfied |

## 3.3.17.3. Beneficiaries' Satisfaction on Project's Services at Subroject under Call-III (Private Farm level)

About 87% of the beneficiary Private Farms under Call-III subprojects (Task-2), which were implemented in 2022, were found satisfied from the project (NLSIP)'s services as reported in the year 2023, in terms of timeliness, relevancy and effectiveness of the project's services. However, 4.7% of the beneficiary Private Farms were moderately unsatisfied and 8.1% of them were unsatisfied. The figures on the level of satisfactions as rated by the sample Private Farms of the sub-projects implemented under Call-III in 2022, have been presented in the following table.

| Table 133: Beneficiaries' Satisfaction Levels on Project's Services under Task-2 (Call-III: Private |
|---|
| Farm level) in 2023   |

| Aspects / degree of<br>satisfactions (N=258) | Highly<br>Satisfied | Moderately<br>Satisfied | Satisfied | Moderately<br>Unsatisfied | Unsatisfied |
|--|---------------------|-------------------------|-----------|---------------------------|-------------|
| Timeliness                                   | 35.0                | 23.2                    | 28.3      | 4.7                       | 8.7         |

## CHAPTER 4: CONCLUSION, KEY ISSUES, LESSONS LEARNED, AND RECOMMENDATIONS

## 4.1 Conclusion

The project has achieved impressive results in terms of reaching households, improving productivity in three value chain commodities, increasing sales values, promoting climate-smart technologies, and increasing high level of beneficiaries' satisfaction.

#### Key achievements of the Project:

#### Impact:

The project has been successful in meeting its goals and has had a positive impact on the intended beneficiaries. The project has brought about favorable changes or benefits for the intended recipients or those directly affected by the project. The major results of the project are given below:

- 1. **Household Reach:** The project has successfully reached 191,665 households, which accounts for 95.8% of the targeted households, showing impressive results.
- 2. **Productive Partnership Alliances:** The project has established partnerships with financial service providers such as banks and insurance companies, which has eventually helped to make it possible to successfully produce and process assets and services for the project beneficiaries.
- 3. **Commodity Productivity:** In comparison to its initial targets, the project has improved commodities productivity with remarkable results. Goat meat production exceeded the goal by 72.8%, buffalo milk by 66.2%, and cattle milk productivity by 97.5%.
- 4. **Increased Sales Value:** The project led to substantial increment in sales values within the milk and goat meat value chains. In comparison to baseline values, the value of milk sales climbed by 67.6%, while the value of goat meat value chain sales significantly grew by 103%.
- 5. **Climate-Smart Technologies:** The project has successfully promoted the adoption of climatesmart technologies among beneficiaries. Compared to a baseline adoption rate of 18.7%, a significant proportion (62.2%) of project beneficiaries have adopted at least one climate-smart technology.
- 6. **Beneficiary Satisfaction:** About two third of the project's beneficiaries showed their high levels of satisfaction. About 66% of beneficiaries expressed satisfaction with Component B services, and an even higher percentage (97%) were satisfied with the project grant supports.

These achievements suggest that the NLSIP project has effectively addressed multiple aspects of livestock and agricultural development, including productivity enhancement, value chain development, technology adoption, and uplifting of overall beneficiary well-being. The project's success can be attributed to its strategic partnerships, targeted interventions, and the positive impact it had on the livelihoods of project beneficiaries.

#### Relevancy

The project has provided the services and resources the enterprises needed in relation to value chain commodities. During project execution, the project's modality was adjusted to accommodate local needs, which included changing to private sector investment for the overall growth of the livestock sector. In order to carry out the project, four Decentralized Local Support Units (DLSUs) were established in four provinces, with efficient connections created at the local and district levels. The

project also established productive alliance with financial institutions to implement the 20:30:50 (equity/loan/grant) investment modality.

The value chain actors were also linked by developing forward and backward linkages as well as horizontal linkages among the actors. The survey showed that 83% beneficiaries were satisfied on services and assets provided by the project, which shows the project's interventions as relevant.

#### Effectiveness

Two levels of help have been offered by the project: institutional and individual household levels. Additionally, the project has strengthened the institutions' capacity building (POs and Private Farms). The project's support has raised the beneficiary households' and institutions' incomes. Likewise, the project has increased the access of beneficiaries in loan and insurance where the women's access has also increased.

#### Sustainability

Even when the project is phased out, the value chain's commodity-based businesses will continue to sustain. The following interventions made by the project would contribute to the sustainability of the enterprises:

**Productive Partnership Alliances Established**: The project has established partnerships with financial service providers such as banks and insurance companies, which has eventually helped to make it possible to successfully produce and process assets and services for the project beneficiaries

**Horizontal and Vertical Business Linkages Established**: The project has supported to value chain actors to establish horizontal and vertical business linkages among the value chain actors for scaling up their enterprises for a longer time.

**Developed Infrastructures**: In order to provide the beneficiaries with the necessary services for an extended period of time, the project has constructed several infrastructures, including livestock markets, storage facilities, breeding centers, service centers, livestock sheds, etc.

**Tools and Equipment Supported**: The project has equipped market centers, veterinary hospitals, chilling centers, service centers, etc from which the beneficiaries would benefit.

**Breeding Centers Strengthened**: The project strengthened cattle and buffalo breeding centers, from wheich the beneficiaries would receive breeding services for their livestocks as per their needs.

**Increased Income**: Value chain commodities are the primary source of household income, which means the business will be in operation for a longer period of time.

### 4.2 Key Issues and Challenges

#### 4.2.1. Issues and Challenges During Endline Survey

During the NLSIP endline survey, the consulting firm faced a number of key issues and challenges that might have an impact on the survey's efficacy and the project's overall evaluation. Below is a breakdown of the main issues and challenges encountered throughout the endline survey:

**Changed Contact numbers of beneficiary sub-projects:** The survey team had trouble locating the sub-projects since the project had not updated the contact mobile number. It took more time to contact them.

**Contact number of sub-projects were not available:** The survey team was unable to locate 350 sub-projects in total (50 from the treatment group and 300 from the control group) due to the lack of contact numbers.

**Subprojects' reluctance to submit data:** The grant recipients whose subprojects performed poorly were reluctant to provide data.

**Difficulty in collecting data from Control sub-projects:** The survey team had several challenges in gathering data from the majority of these control sub-projects, since the project furnished a list of sub-projects that were not granted the funding but yet submitted their business plans to the project.

**Limited Support to POs (institutional support only):** Due to limited support (only institutional, not in production), a small number of PO members are sustaining their businesses.

**Delayed release of sub-projects grant installment:** The project has started to release first installment to Call 3 sub-projects from July 2023. The study team collected the data during the period of June 2022 to June 2023. These sub-projects showed very little progress. These sub-projects were also reluctant to provide the data.

**Missing beneficiary names in the community:** Most of the name list provided by the project under Task-1 were not found in the community.

**Sub-projects not implemented on time:** Due to non-release of the grant installment on time, many sub-projects are delayed in implementation and have low progress, and had to pay the bank interest without production.

**Coordination with beneficiaries during data collection:** It was challenging to get data from the beneficiaries because they had very high perception of the project and the fact that the majority of them did not coordinate with the consulting firm.

#### 4.2.2. Issues and Challenges in Project Implementation

The following is a list of the implementation level issues and challenges that the NLSIP endline survey identified and that have impacted the project's outcoms and efficacy.

**Investment to private sector is not parallelly done:** Effectiveness of the grant sub-projects has been low because of delay in investing in private sectors.

**Delay in installment release:** Effectiveness of the grant sub-projects has been low because of delayed installment release.

**Forward linkage with value chain actors only:** Only forward linkage of value chain actors has been established. To establish strong value chain at community level, the project has to focus on backward linkage of value chain actors as well as for sustainability of the value chain and sector growth.

**Less supports to POs under Component B:** The beneficiaries under component B received very minimum supports for the production of value chain commodities. Value chain linkages have not been established among the value chain actors, despite the project's support in the construction of buildings and providing equipment to government agencies, including Veterinary Hospital and Livestock Expert Centers (VHLECs), Livestock Sections of Palikas, and Livestock Market Centers (Palika).

Effects of Covid 19: The Covid-19 had a significant impact on the project's ability to offer services to the beneficiaries.

Weak Project Database and Monitoring System: A well-designed and effective project monitoring system helps the beneficiaries make the most use of grant funding while guiding them to scale up and maintain their enterprises. It was found that the project is not able to track their beneficiaries who left the enterprise due to non-release of grant installment in time. Some beneficiaries were found to have sold out their livestocks after receiving grant to pay the loan, which was taken under the project financial partnership provision.

## 4.3 Lessons Learned

During the implementation of the project, several lessons were learnt. Here is a summary of the lessons that were discovered during the endline survey, which could help future projects of a similar nature be implemented more effectively.

- 1. Collaboration with financial institutions effectively fulfills the financial needs of producers: They established strong partnerships with financial entities to provide producers with funds they need to grow their enterprise.
- 2. Innovative interventions increase the volume of production: innovations as a means to enhance production and productivity in the agricultural and livestock sectors including Silage Making Machine, Milking Machine, AI, Milking Parlor, among others. Investing in modern technologies and practices can drive efficiency, boost yields, and improve the overall quality of products.

## 4.4 Recommendations

The following are some key recommendations for future project development and implementation.

- 1. A Strong M&E System: A robust M&E system ensures effective tracking of project progress, identifies challenges, and allows for timely adjustments. It allows improved accountability, better decision-making, and the ability to measure and showcase project outcomes.
- 2. Establishment of Forward and Backward Linkages: By connecting producers with both suppliers (backward linkage) and buyers (forward linkage), a comprehensive value chain is created, enhancing market access and sustainability. It strengthenes market connections, increases efficiency, helping build a more integrated and resilient sector.
- 3. **Private Sector Mobilization**: Involvement of the private sector across the value chain stimulates investment, innovation, and growth. It enhances sector development, increases investment, and improves access to resources and expertise, helping the private sectors play vital roles.
- 4. Establishment and Operation of Community Livestock Extension Service Center (CLESC): Local community-based livestock extension centers provide direct support and knowledge transfer to producers, leading to improved practices and outcomes. Enhanced technical assistance, better adoption of best practices, and increased productivity at the community level through the CLESC.
- 5. Development of Production Pockets/Clusters: Concentrating efforts on specific geographic areas can lead to efficient resource allocation and targeted developmental impact. Enhanced focus, better resource management, and localized impact within chosen production pockets or clusters support the sustainable growth of the rural economy at the sectoral level.
- 6. **Project's focus on export quality production and link with exporters:** Prioritizing exportquality production and creating linkages with exporters taps into higher-value markets and boosts economic returns, which in turn helps increase income for producers, expand market

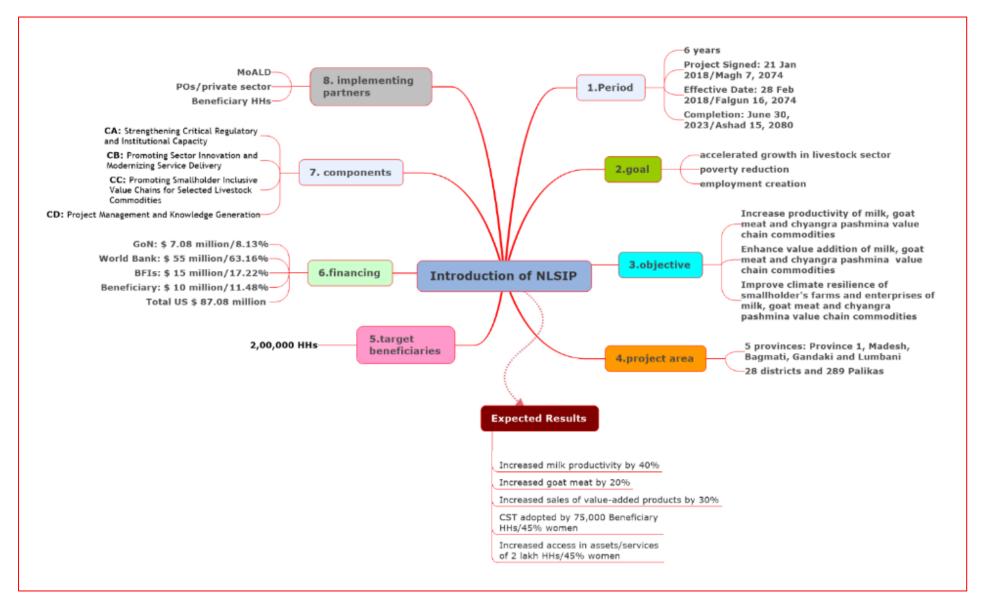

opportunities, and improve overall competitiveness and assist the country in obtaining foreign exchanges.

- 7. **Institutionalization of strategies, learnings and results:** The government has to institutionalize the project's strategies: productive alliance, modality of investment, innovation, business plan, stakeholders' dialogue platform (private sector leadership), grievance redress committee, high productivity, value addition to promote overall sector development and make them applicable to the districts and remaining value chain commodities.
- 8. Carry out Social Audit of the Sub-projects: The survey team strongly recommend to the NLSIP, Ministry of Agriculture and Livestock Development (MoALD) and the World Bank to conduct a social audit of the 449 sub-projects that have been implemented thus far. This audit should involve direct beneficiaries, representatives of local and provincial governments, the project, and other GoN institutions.
